Overview

- WSID 5% rear-seat sled tests
- WSID 5% & 50% front-seat sled test
- Hardware issues
- High speed Car-to-Car intersection crash
- UVa / Autoliv WSID-PMHS impactor tests

Rear-Seat Sled Tests

-setup

- Sled rig
 - Half body in white
 - from a compact sized car
 - Vehicle door trim, lower c-trim and rear seat
 - Lincap vehicle pulse
 - From NHTSA test
- Dummy
 - SIDII, WorldSID5%

Rear-Seat - Sled test

No Side Airbag

Rear-Seat - Sled test

Standard Thorax/Pelvis Side Airbag

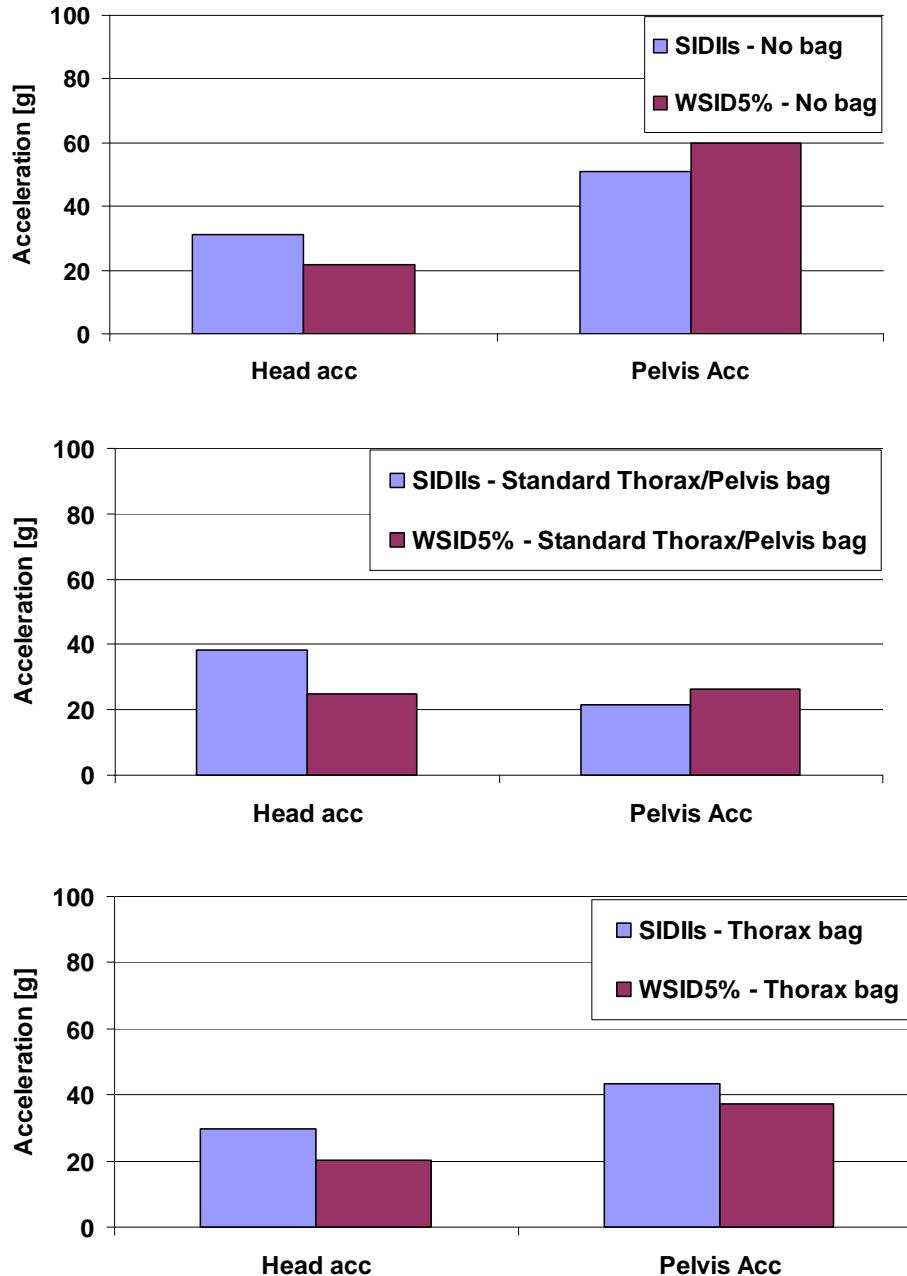

Rear-Seat - Sled test

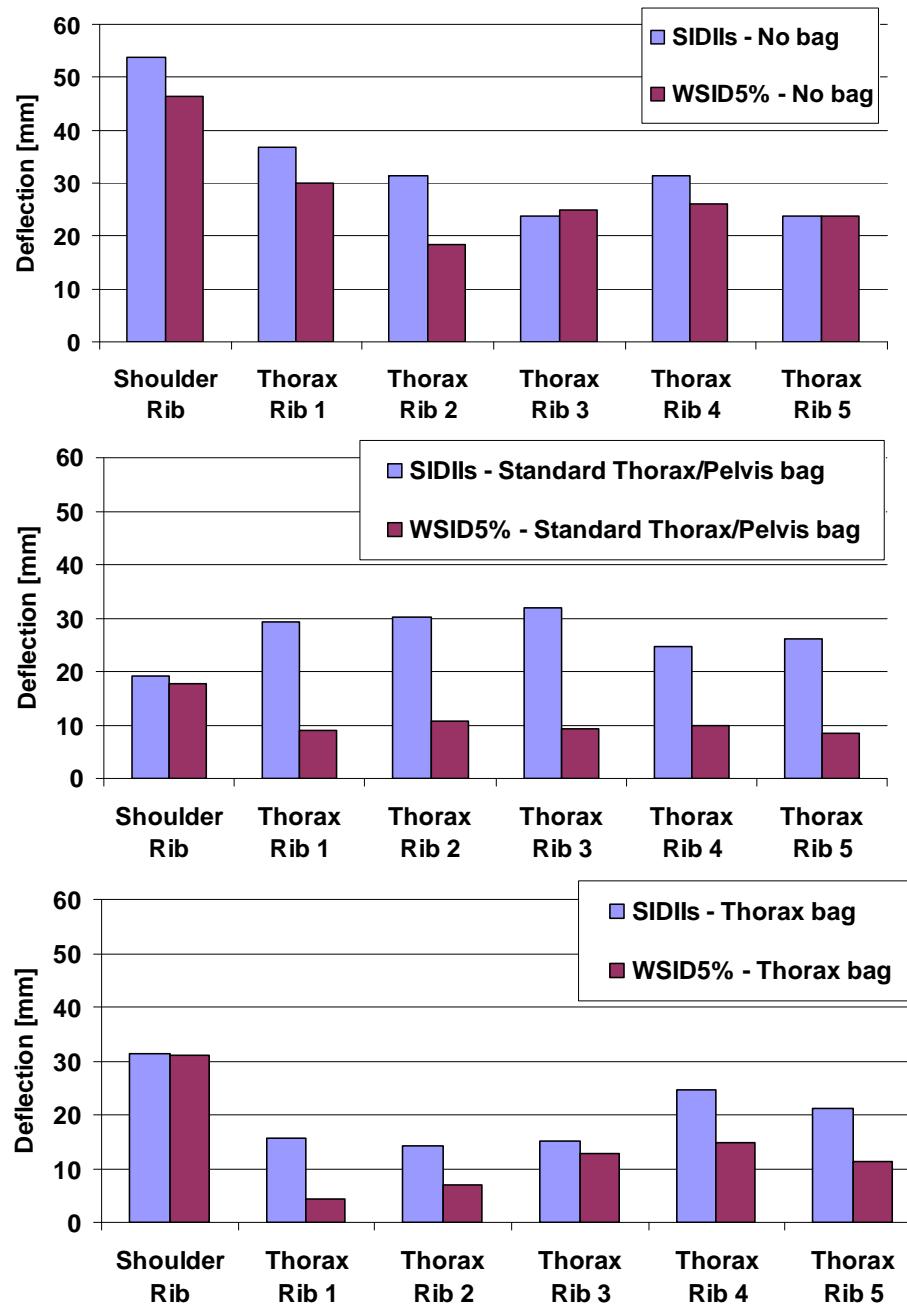

Thorax Side Airbag

Rear-Seat - Sled test

Rear-Seat - Sled test

Conclusions

- Different kinematic behavior for WSID 5% compared to SIDIIIs
- Difference in deflection measurement for WSID 5% vs SIDIIIs
- Need of reliable and acceptable risk functions
 - Dummy comparison
 - Front- and rear seat comparison
- More measurements in pelvis

Front-Seat Sled Tests

-setup

- Sled rig
 - Intruding door side
 - Generic padding as door panel
 - Front seat
 - Generic EuroNCAP pulse
 - Dummy
 - WorldSID 50%, WorldSID 5%

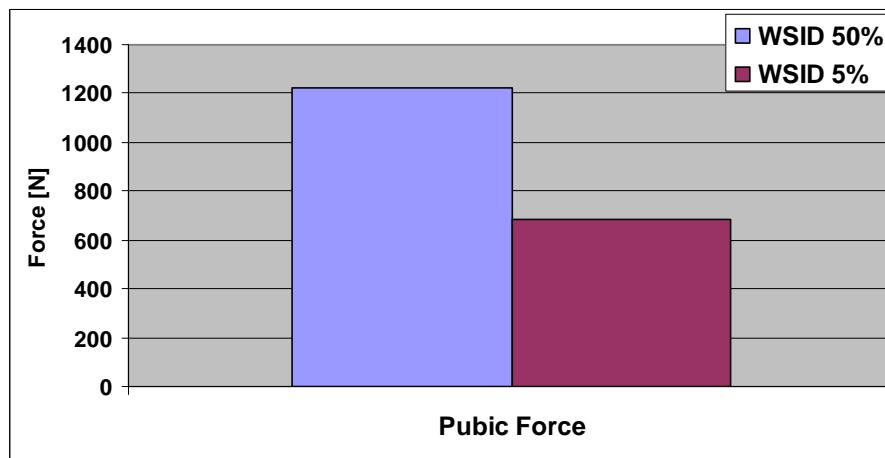

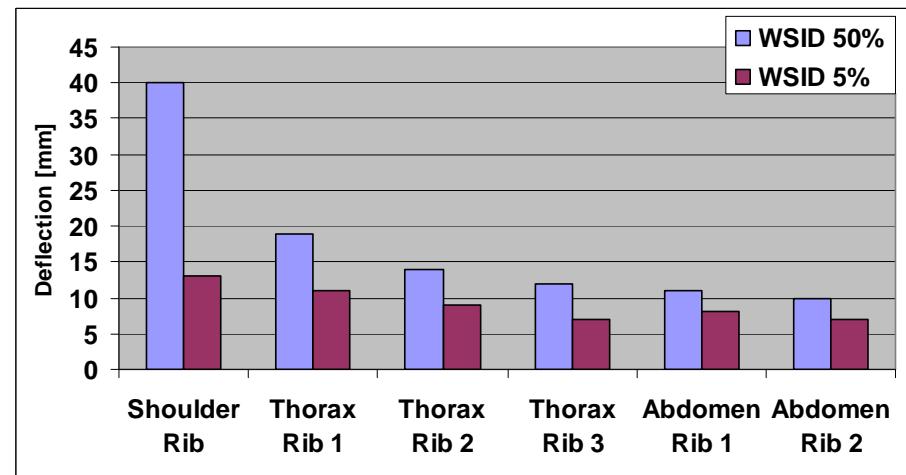

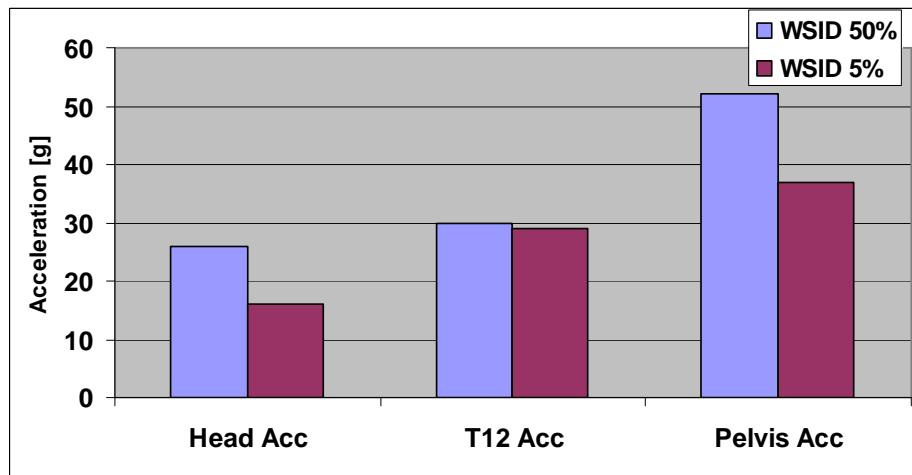

Front-Seat - Sled test

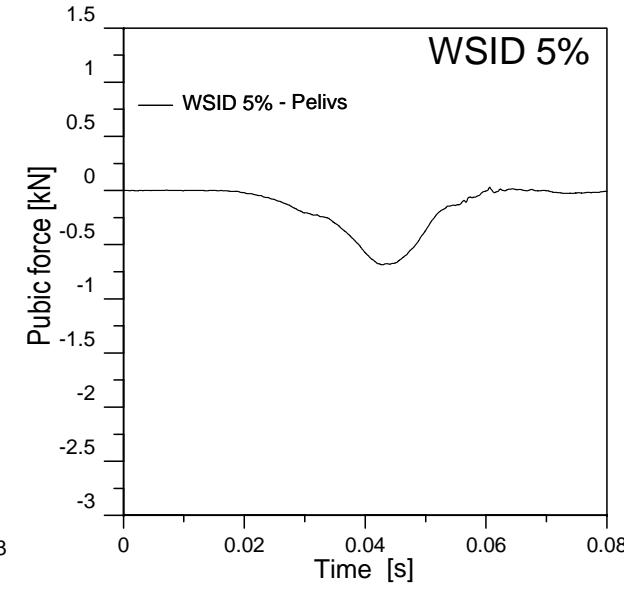

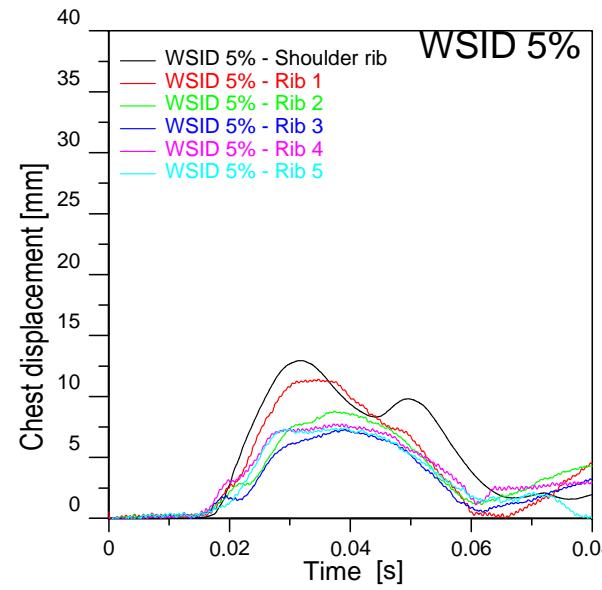

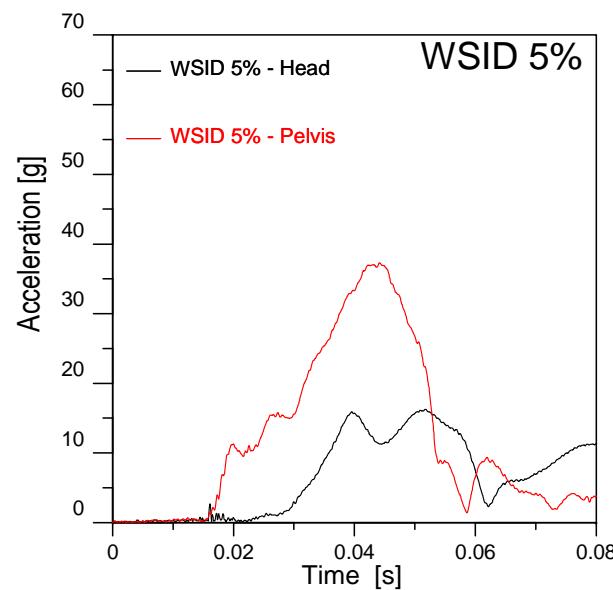

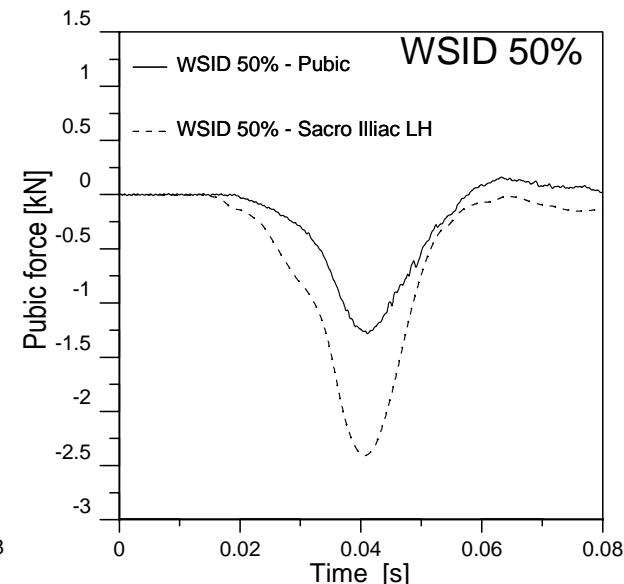

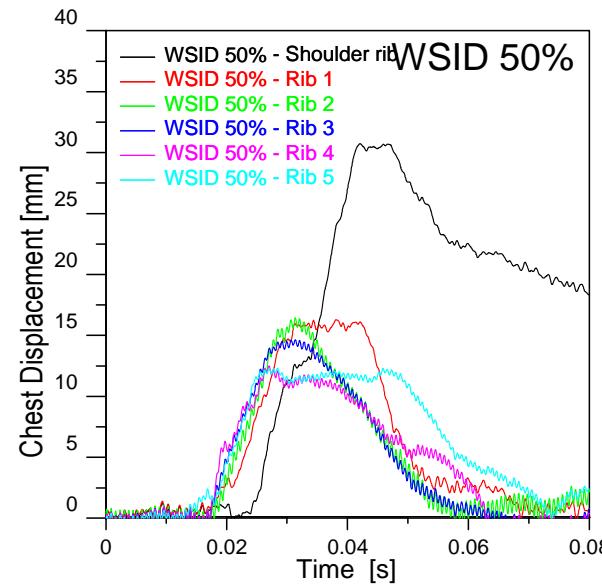

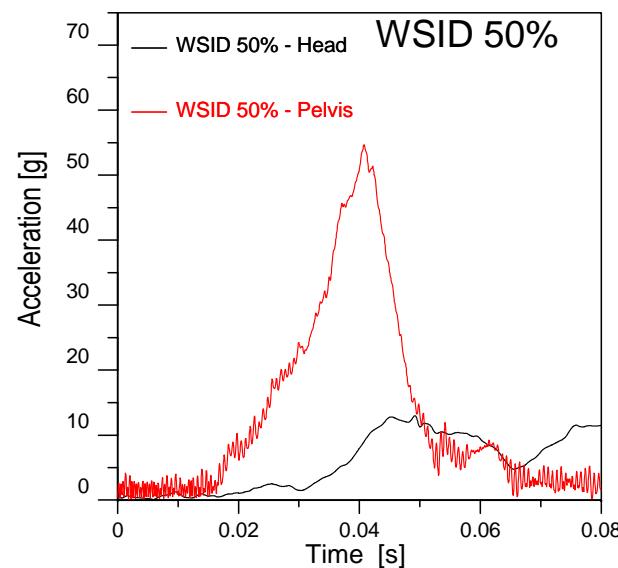

EuroNCAP generic pulse-
Thorax Side Airbag

Dummy measurements – WSID 50% & 5%

Front-Seat Sled Test – WSID 50 & 5%-ile

Hardware issues

- WSID 5&50% Pelvis measurement lost in many tests
 - Pubic load cell
 - Sacro Iliac load cell
- Neck torn on WSID 5%
- WSID 50% Range of motion for Shoulder IR-TRACC
 - Broken in 214 Pole test

Improved side impact protection in the traffic of the future – car to car full vehicle crashes with WorldSID 50%

CHALMERS

Full-scale tests

Bullet & Target:

Impact speed:

Purpose:

2009

Mid size vs. Mid size	55 km/h	
Mid size vs. Mid size	70 km/h	Influence of Impact speed
Mid size vs. Mid size	80 km/h	
Mid size vs. Small car	55 km/h	Influence of mass ratio

2010

Older vs. Older	55 km/h	Relation to real life data
Older vs. Older	70 km/h	
Plattform SUV vs. Mid size	65 km/h	Influence of mass and compatibility
Frame SUV vs. Mid size	65 km/h	
AE-MDB vs. Mid size	60 km/h	Potential future load case
Mid size versus Mid size	70 km/h / 30 km/h	Representative intersection crash

Intersection crash

Intersection crash

- AIS3+ Injury risks (Petitjean et. al 2009, survival method)

Shoulder 1.5 %

Thorax / 1.0 %
Abdomen

Pelvis 24.0 %

Project Highlights

- WorldSID improved tool for side impact evaluation
- Good structural integrity of all target vehicles
- SAB presence reduce the occupant thoracic injury risk
- Thorax Injury Risks < 10% for a 45 year old occupant

Additionally...

Future focus for side impact protection

1. Pelvis loading
2. Occupant-to-Occupant Interaction
3. Rear-Seat
4. Senior occupants

WorldSID related Conclusions

WorldSID – good tool for evaluating overall side impact occupant protection.

- Spine kinematic
- Bi-lateral loading
- Ability to measure low and high crash severities
- Different response from different side airbag concepts

Specific points of interest:

- Rib rotation
- Shoulder kinematics
- Pelvis measurement and injury risk
