

Comparison of WorldSid and PMHS response to localized constant-speed impacts

Damien Subit, Cecilia Sunnevang, Richard Kent

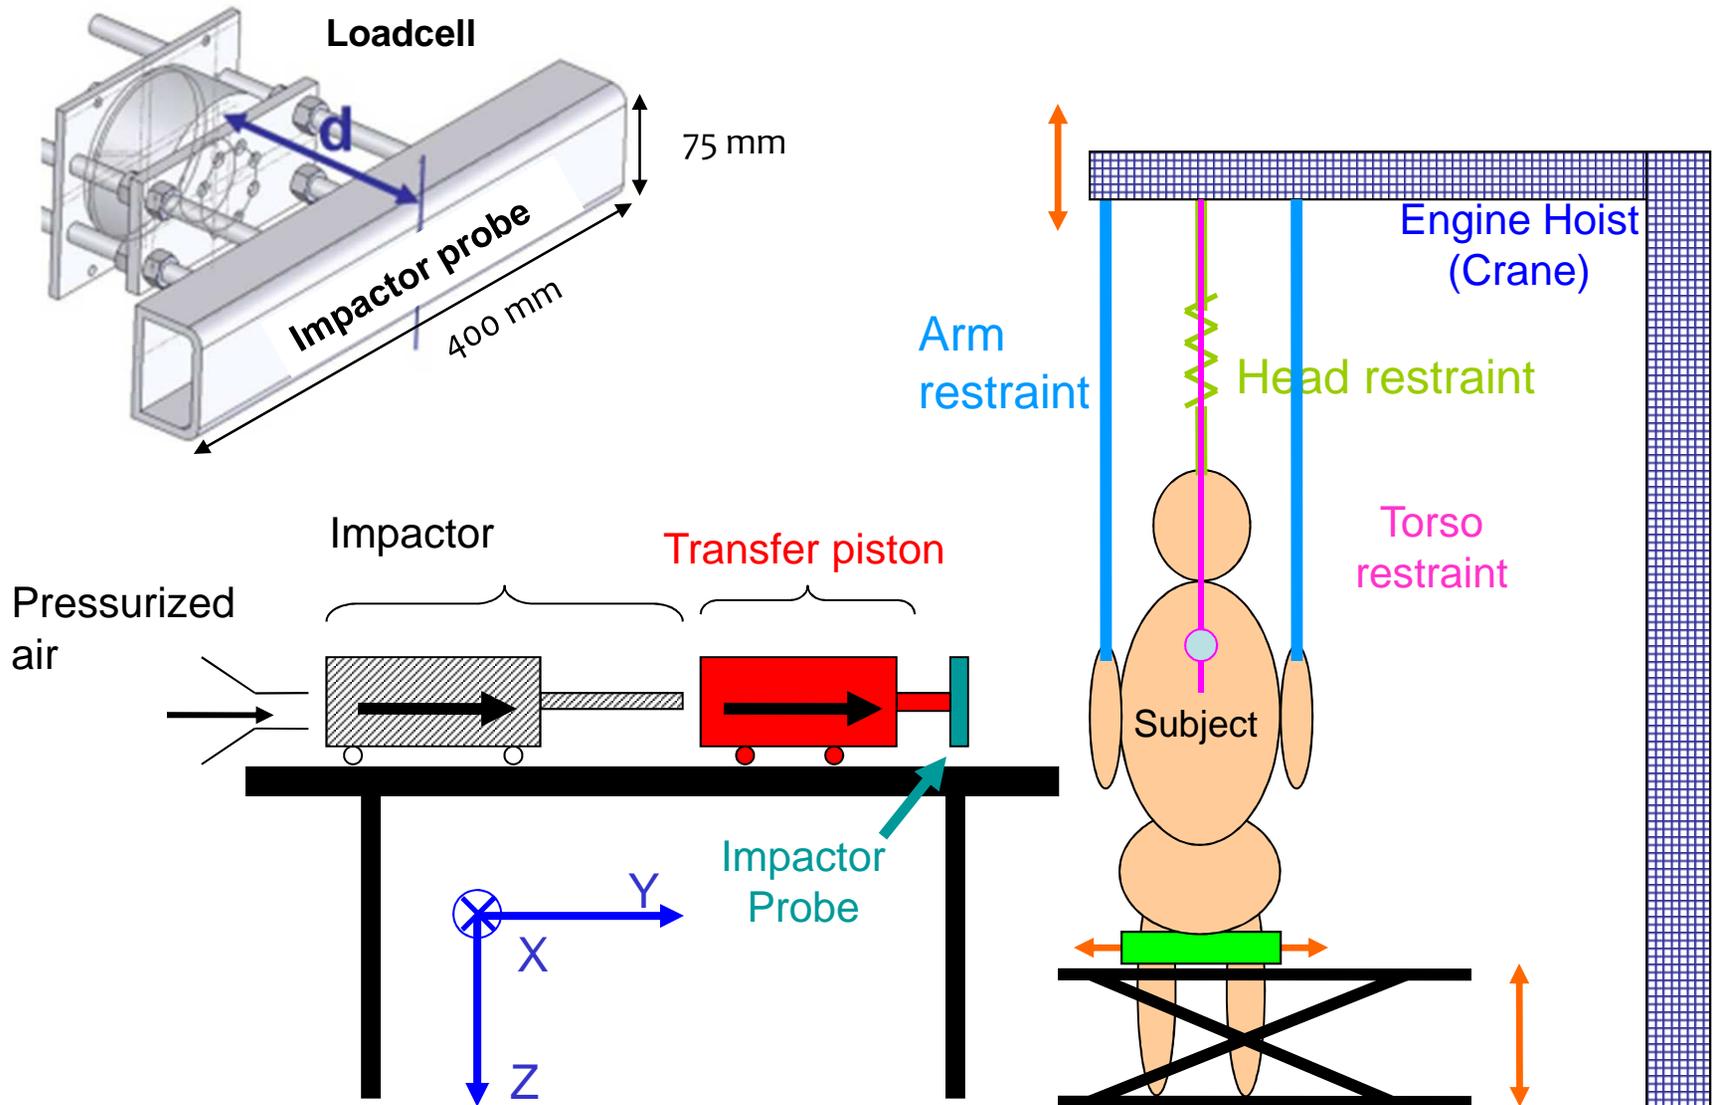

Center *for* Applied Biomechanics

Objectives

- Constant-velocity impact to shoulder and thorax (2 velocities, 3 directions, 3 levels)
- Comparison to previously published cadaver data (Subit et al, AAAM 2010)
- Chest deflection: 1D, 2D IR-Tracc, external measurement

Response of the Worldwide Side Impact Dummy (WorldSID) to localized constant-speed impacts (Sunnevang et al, under review AAAM 2011)

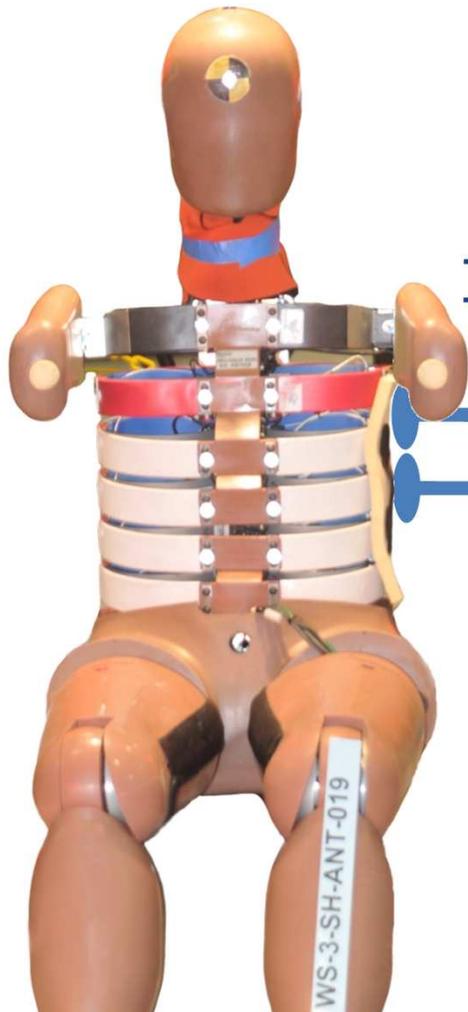

Side impact set-up - Posterior View

Test Conditions

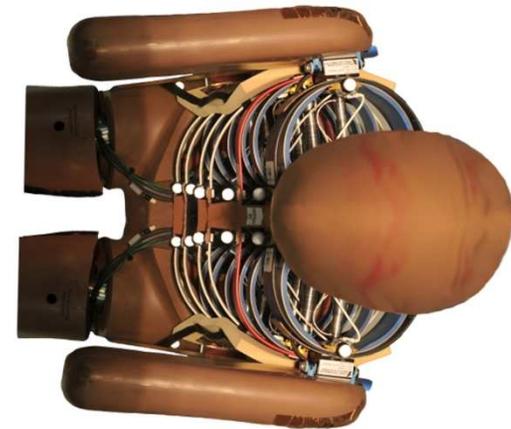

Two Speeds

1 m/s and 3 m/s

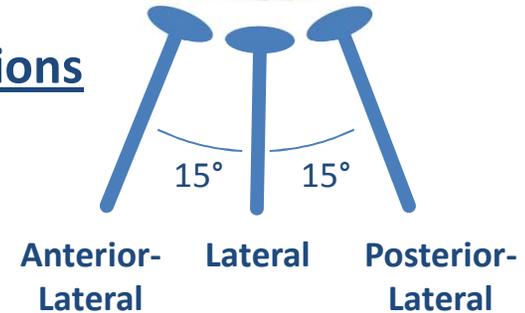

Three Locations

- Shoulder
- Upper Thorax
- Mid Thorax

Three Directions

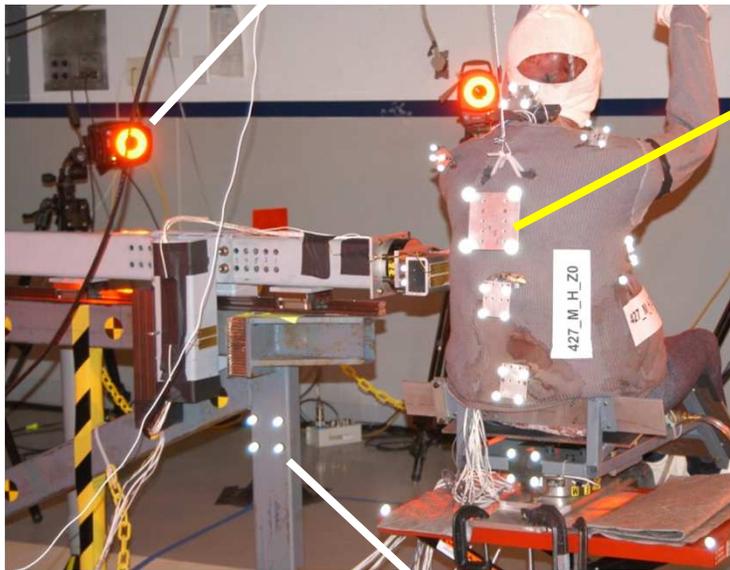

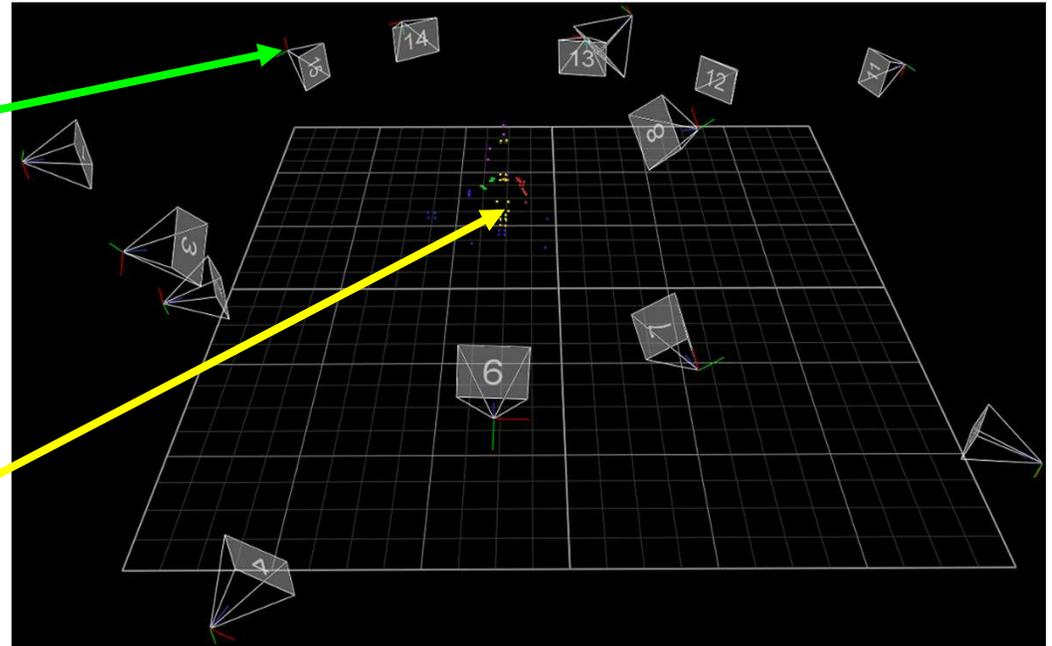

Stroke: 100 mm

With/without jacket

SETUP: 15 Camera Vicon Configuration

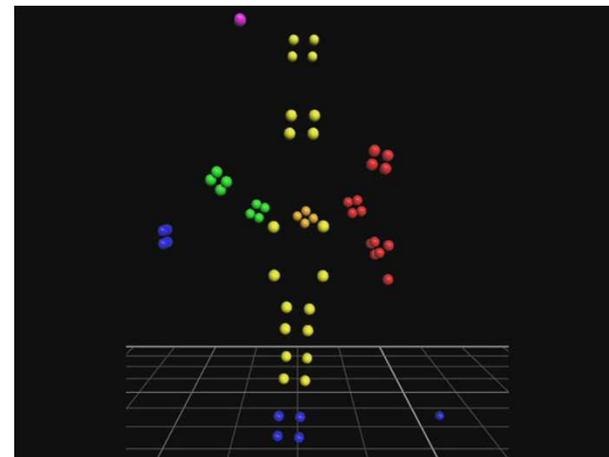

15 Vicon
MX
Cameras
1000 Hz

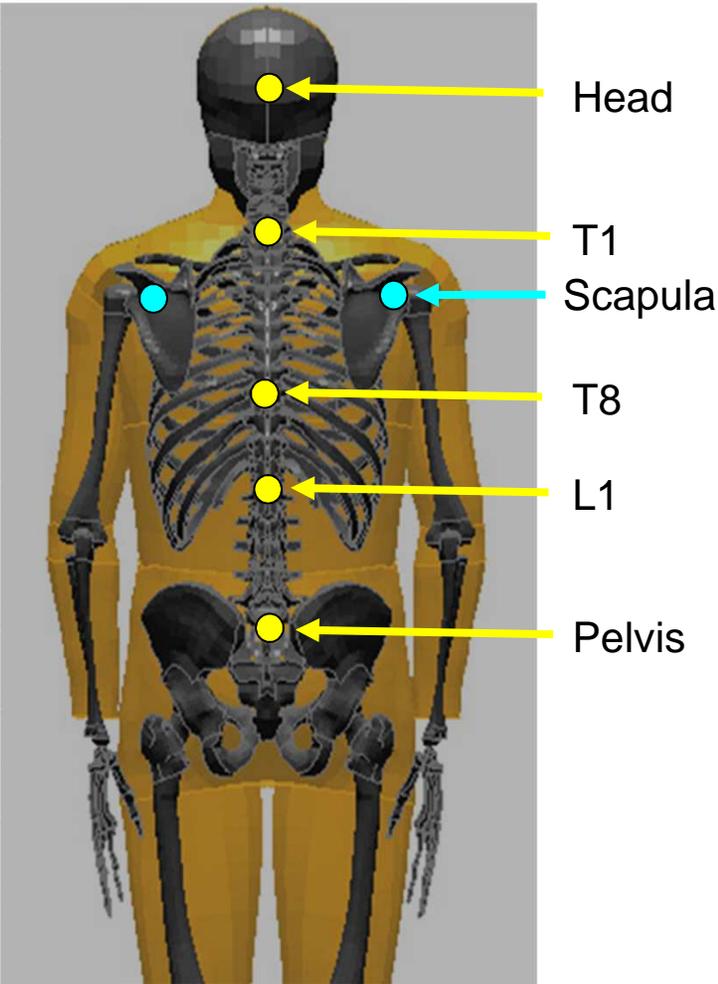

Retro-
reflective
Markers

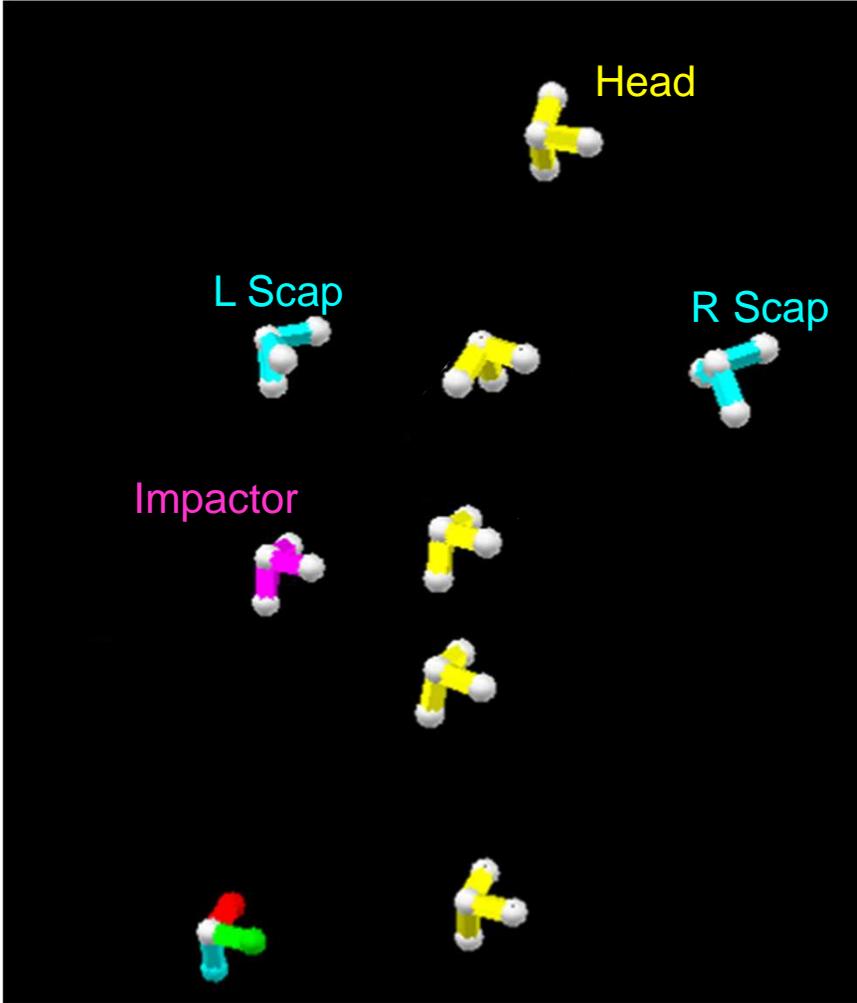

Captured Motion

Bone Based Coordinate Systems

Dummy

Vicon Hardware: 4-Marker Clusters

Rigid attachment to anatomical locations via specialized hardware

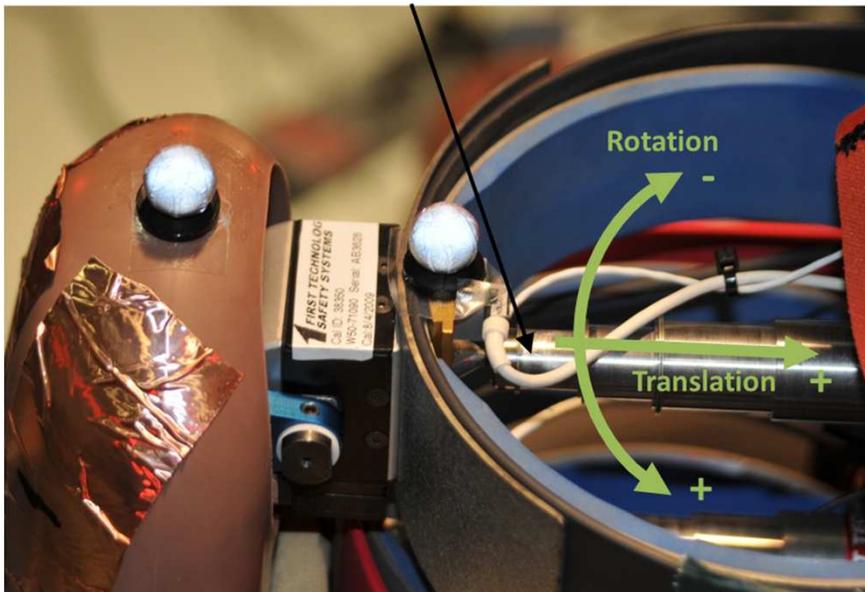

Impact force

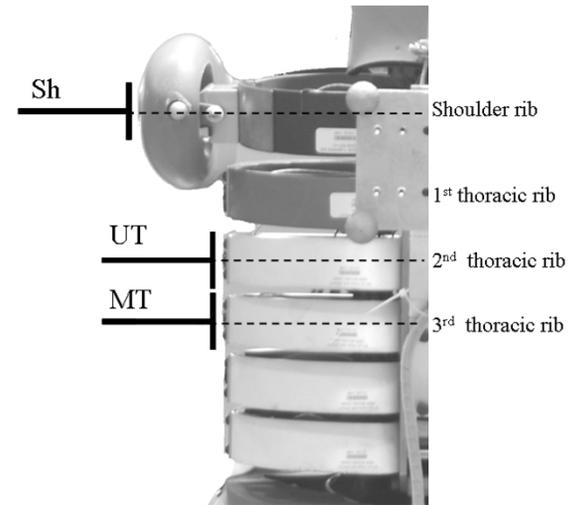

Chest lateral deflection

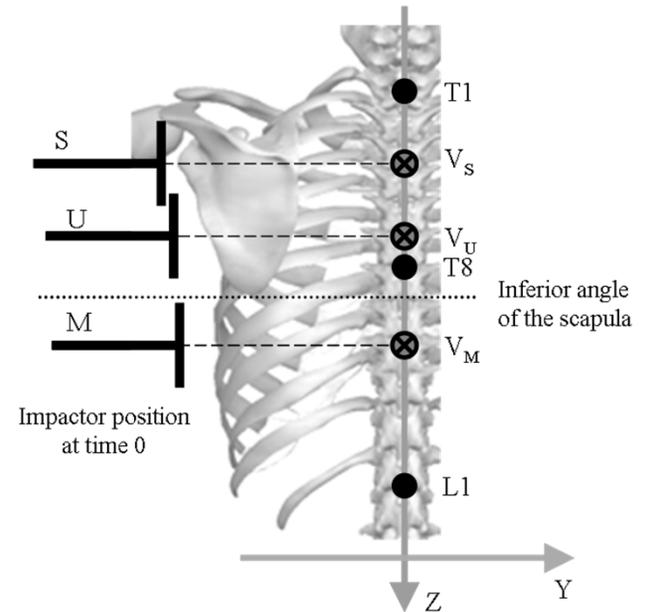

Dummy Rib Deflection Sensor IRTracc

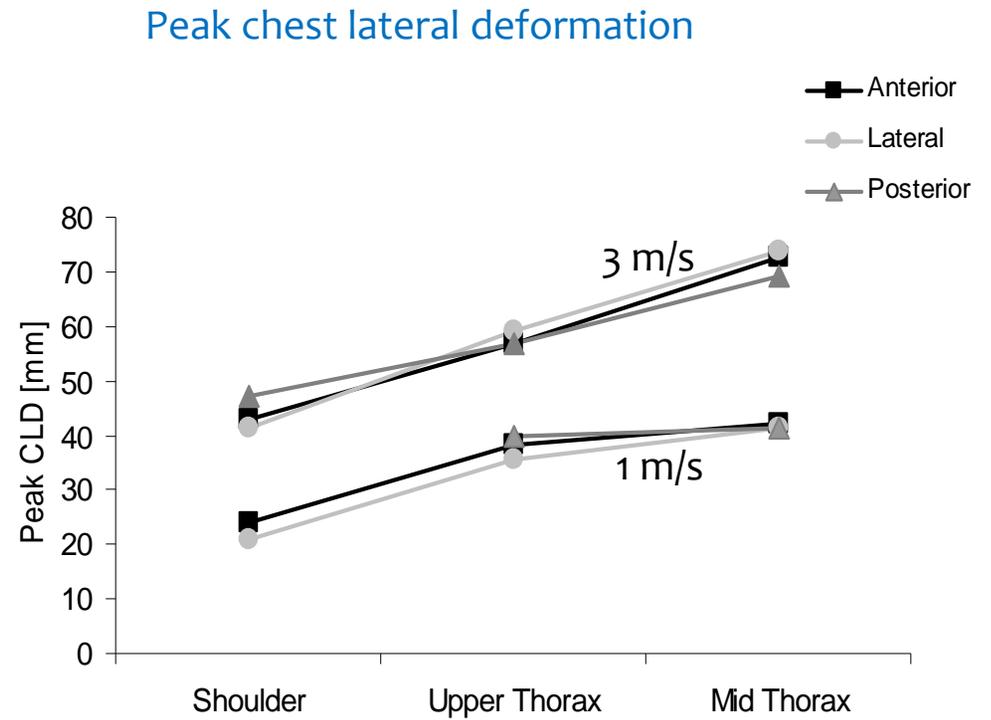

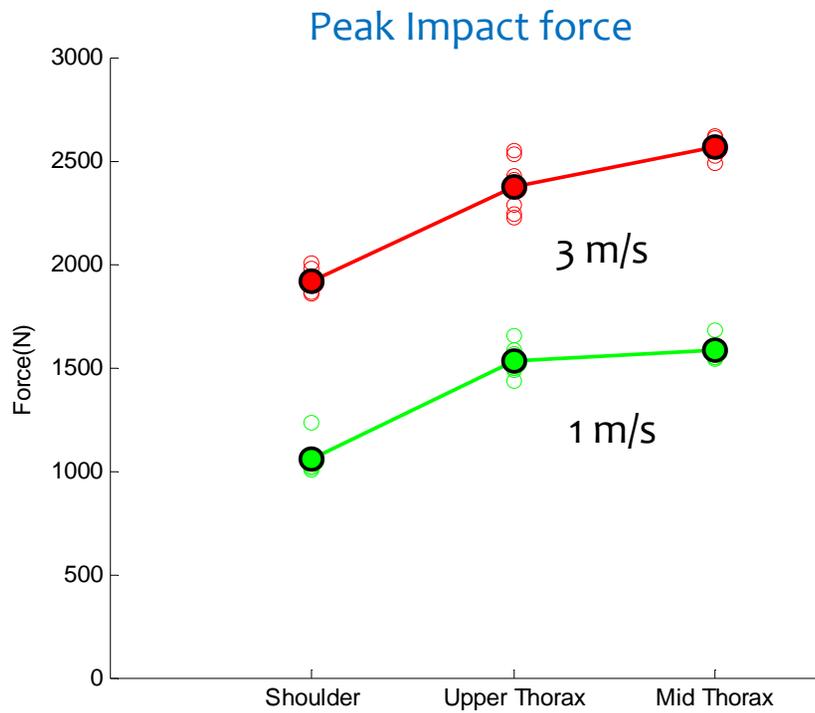

Internal deflection (1D, 2D)

External deflection

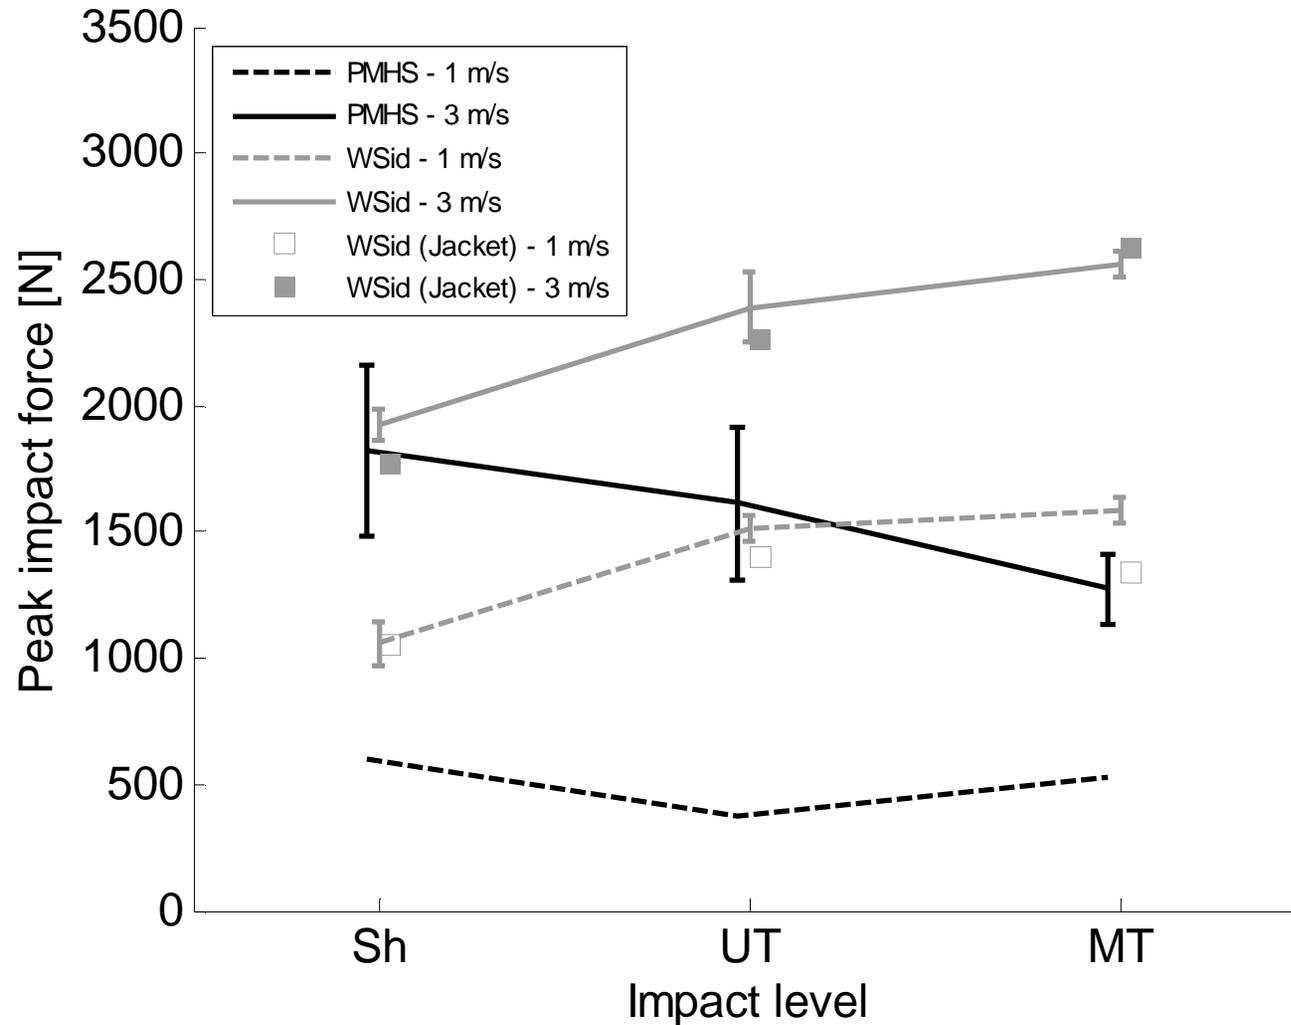

Trend for WorldSID

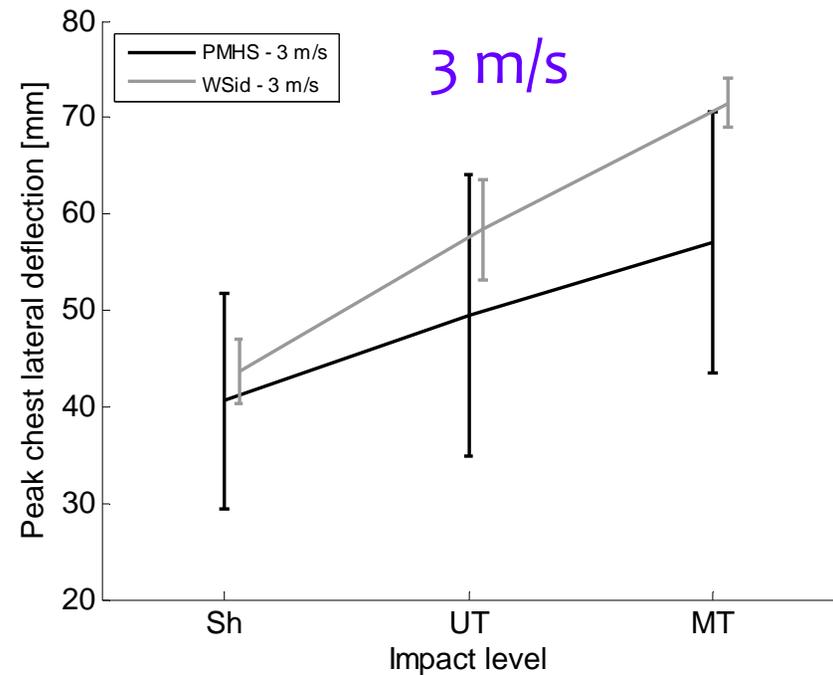

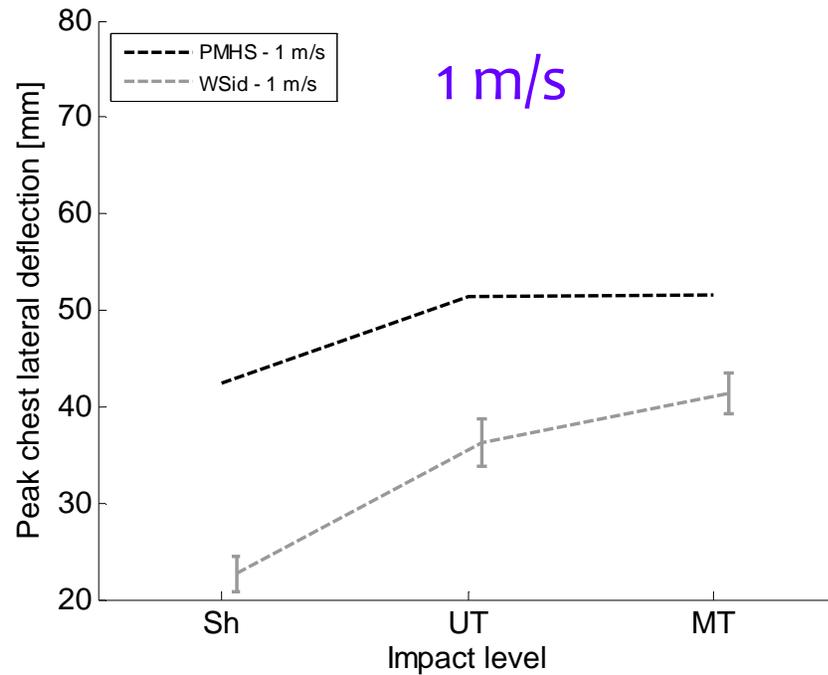

PMHS/WorldSID comparison

Peak impact force

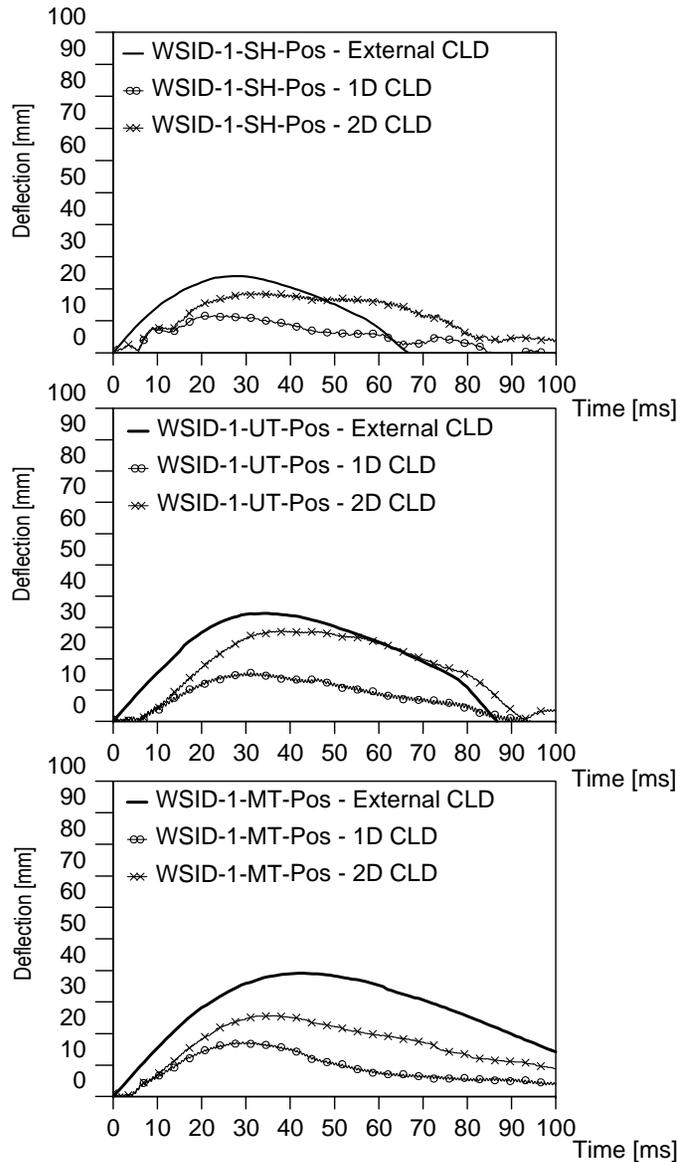

PMHS/WorldSID comparison

Peak external deflection

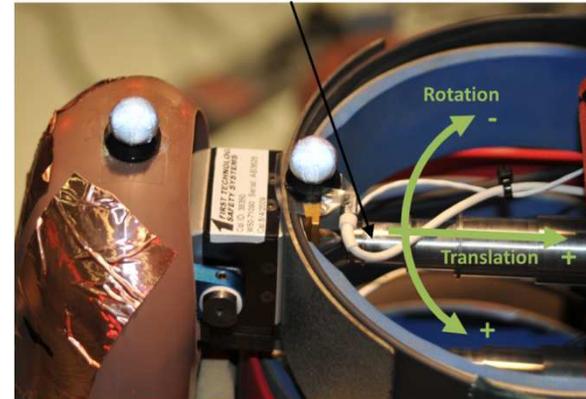

Work in progress

1D vs 2D chest deformation

Dummy Rib Deflection Sensor IRTracc

	Shoulder		Upper Thorax		Mid Thorax	
	1D / Ext.	2D / Ext.	1D / Ext.	2D / Ext.	1D / Ext.	2D / Ext.
Anterior	0.7	0.8	0.5	0.6	0.4	0.5
Lateral	0.9	0.9	0.7	0.7	0.5	0.5
Posterior	0.6	1.0	0.5	1.0	0.4	0.7

Future research

- Investigate differences in deflection
- Investigate differences in trend (3 m/s)
- Spine kinematics/rib cage deformation
