UBIMET – THE RAILWAY WEATHER SERVICE

- ▶ One of the largest meteorological institutes in Central and Eastern Europe
- ▶ **International corporation** with branches from Austria to Australia and **more than 150 employees (mostly scientists)**
- ▶ Specialized in **forecast and warning systems for railway operators** and other infrastructure businesses
- ▶ **Main supplier** of meteorological data for the **Austrian Federal Railroads (ÖBB)**

UBIMET - Company Structure

50%

50% private trusts

UBIMET GmbH
Austria - Vienna

- ▶ Founded 2004 in Vienna, Austria
- ▶ International & global meteorological services service
- ▶ Market and innovation leader regarding severe weather warnings
 - ▶ more than 1.5 mio recipients
- ▶ Specialized in forecast and warning systems for railway operators and other infrastructure businesses
- ▶ High resolution weather forecast models and very local predictions systems

UBIMET – Head Quarters

Vienna, Austria

Meteorological Head Office
Weather Warning Centre

Forecast- & Research
Centre

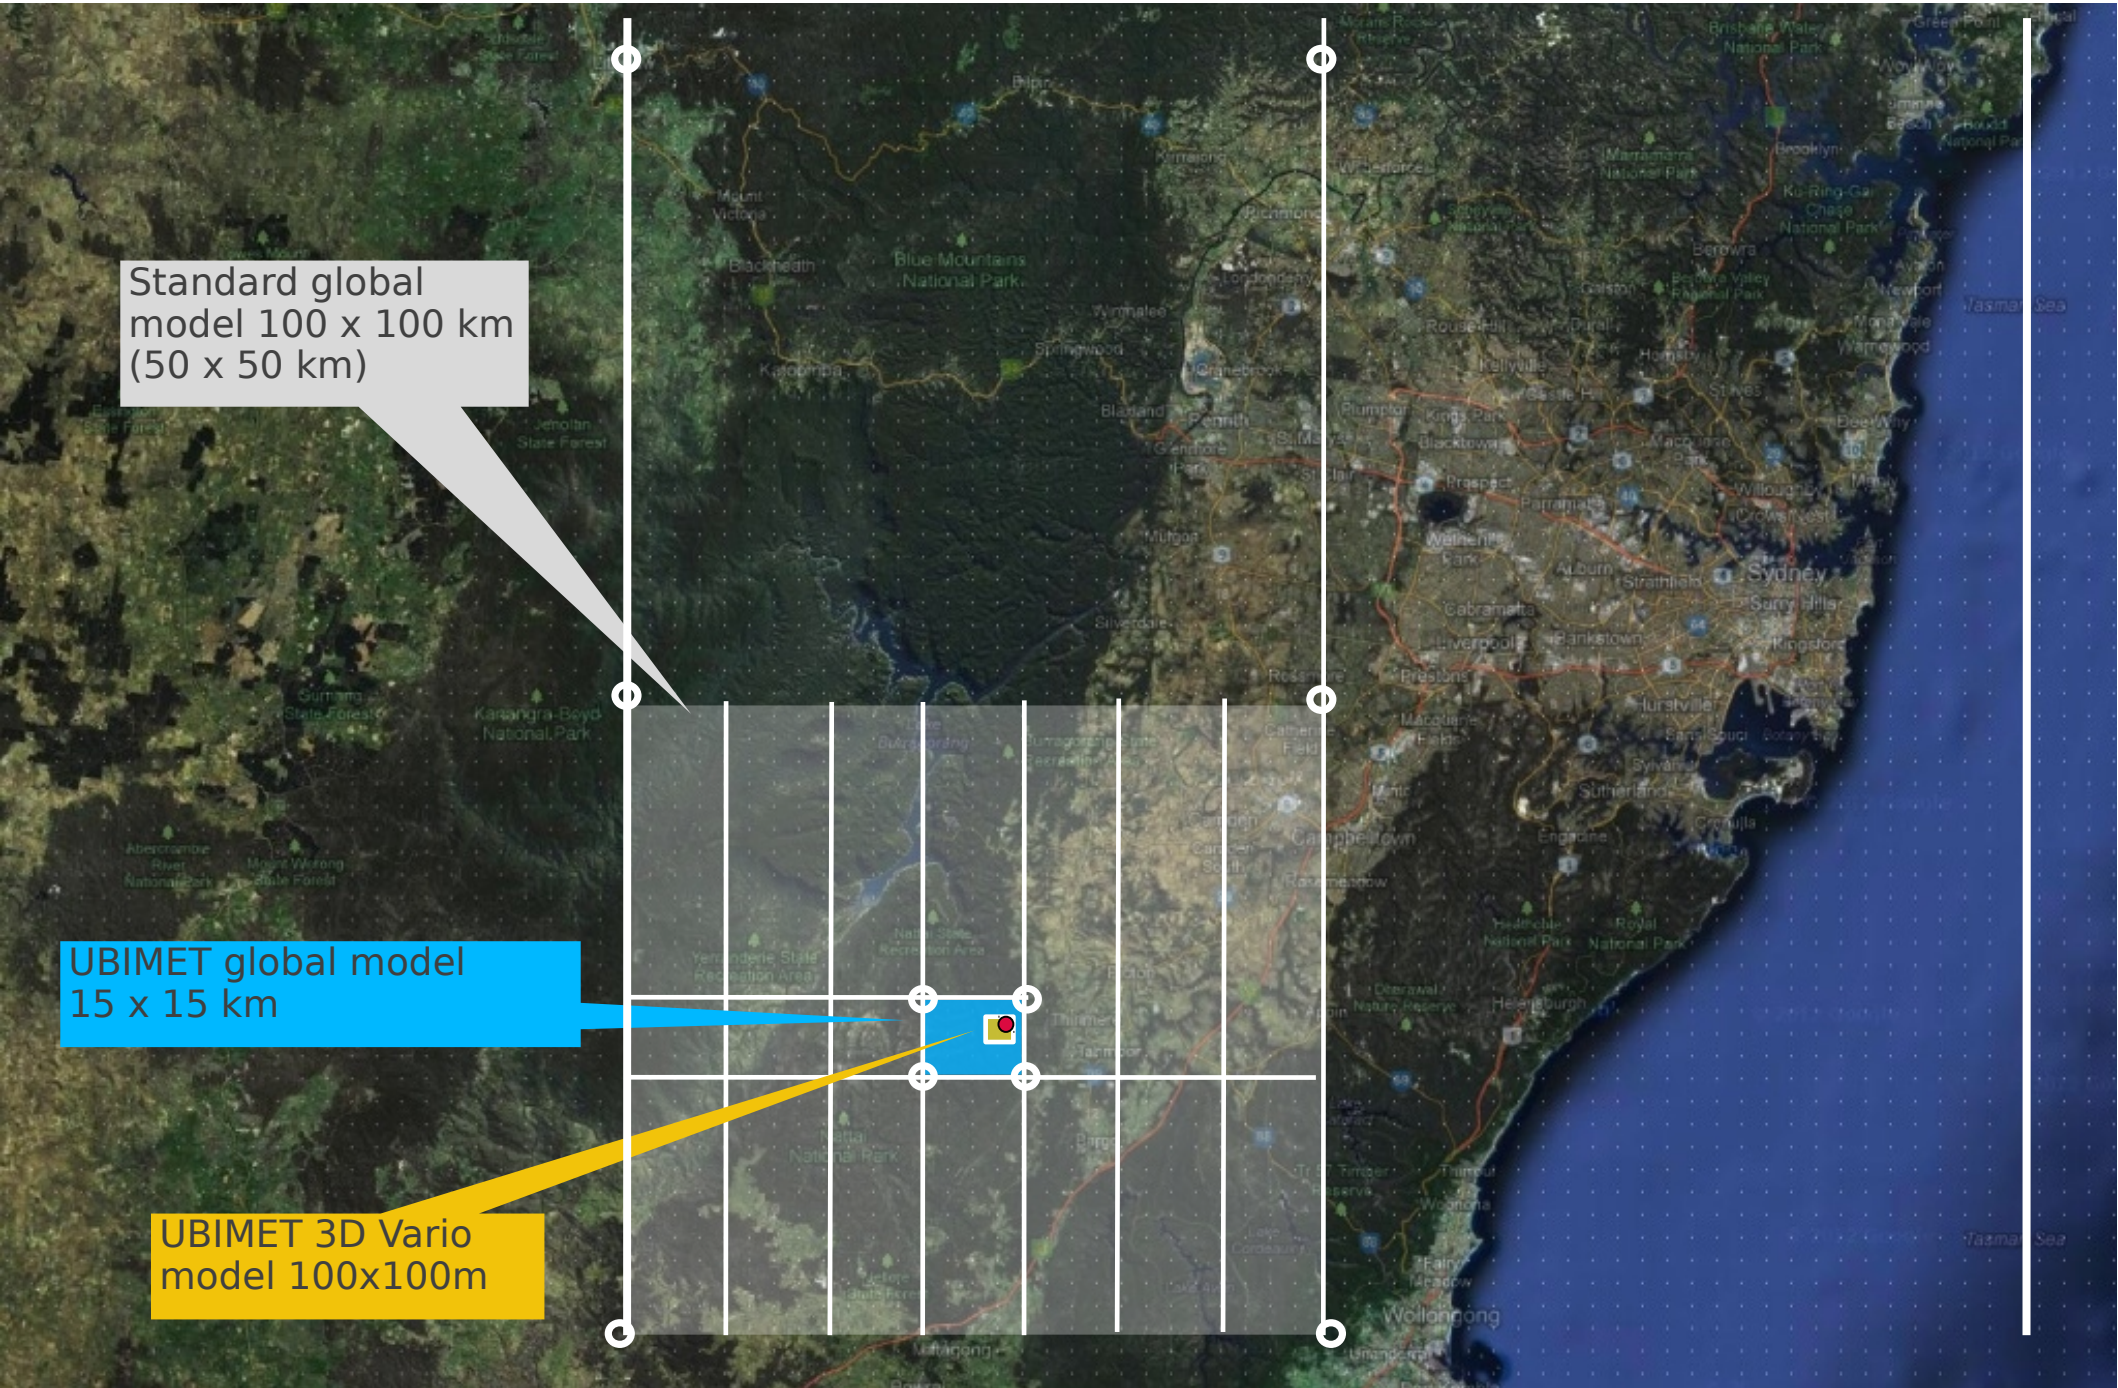

Our advantage – more detailed forecast models

Standard global model 100 x 100 km (50 x 50 km)

UBIMET global model 15 x 15 km

UBIMET 3D Vario model 100x100m

Advantage in mountainous regions

UBIMET

Forecasts for every single location in real time

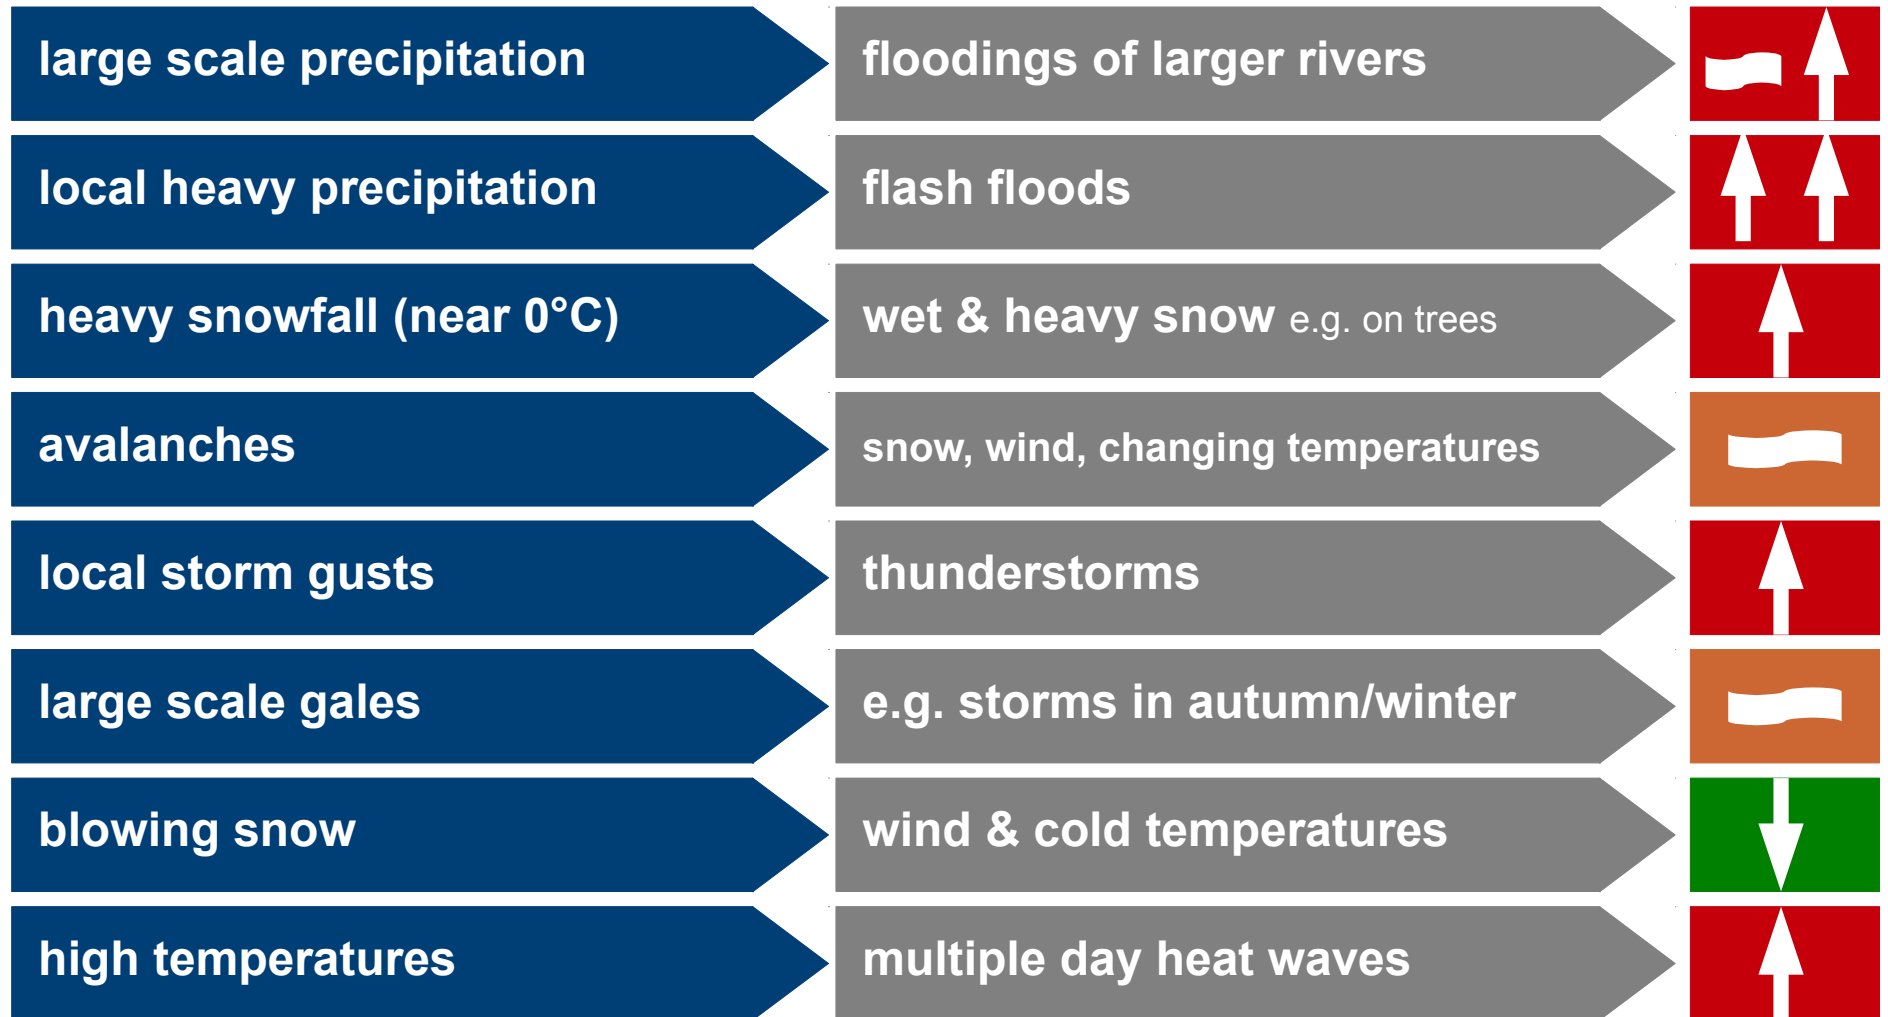

BASE MODELS

Forecasts fore large areas recalculated 2-4 times a day

RAILWAYS AND CLIMATE CHANGE

Climate change study by the Austrian Railways

ÖBB, Umweltbundesamt, BOKU Vienna

Recommendations based on the study

- ▶ Considerations of future climate change and meteorological conditions during the **planning phase of new railway lines**
- ▶ **Creation of awareness inside your company** about climate change and severe weather phenomena
- ▶ Encouragement of **knowledge transfer** with other companies, scientific institutions, networks and railroads.

How to be prepared for climate change challenges?

Best Practice Example: ÖBB infra:wetter

▶ In 2005 the Austrian Federal Railroads (ÖBB) implemented a ubiquitous Weather Information System, called **infra:wetter**, in order to be more prepared for extreme weather events!

▶ **Goals of the System:**

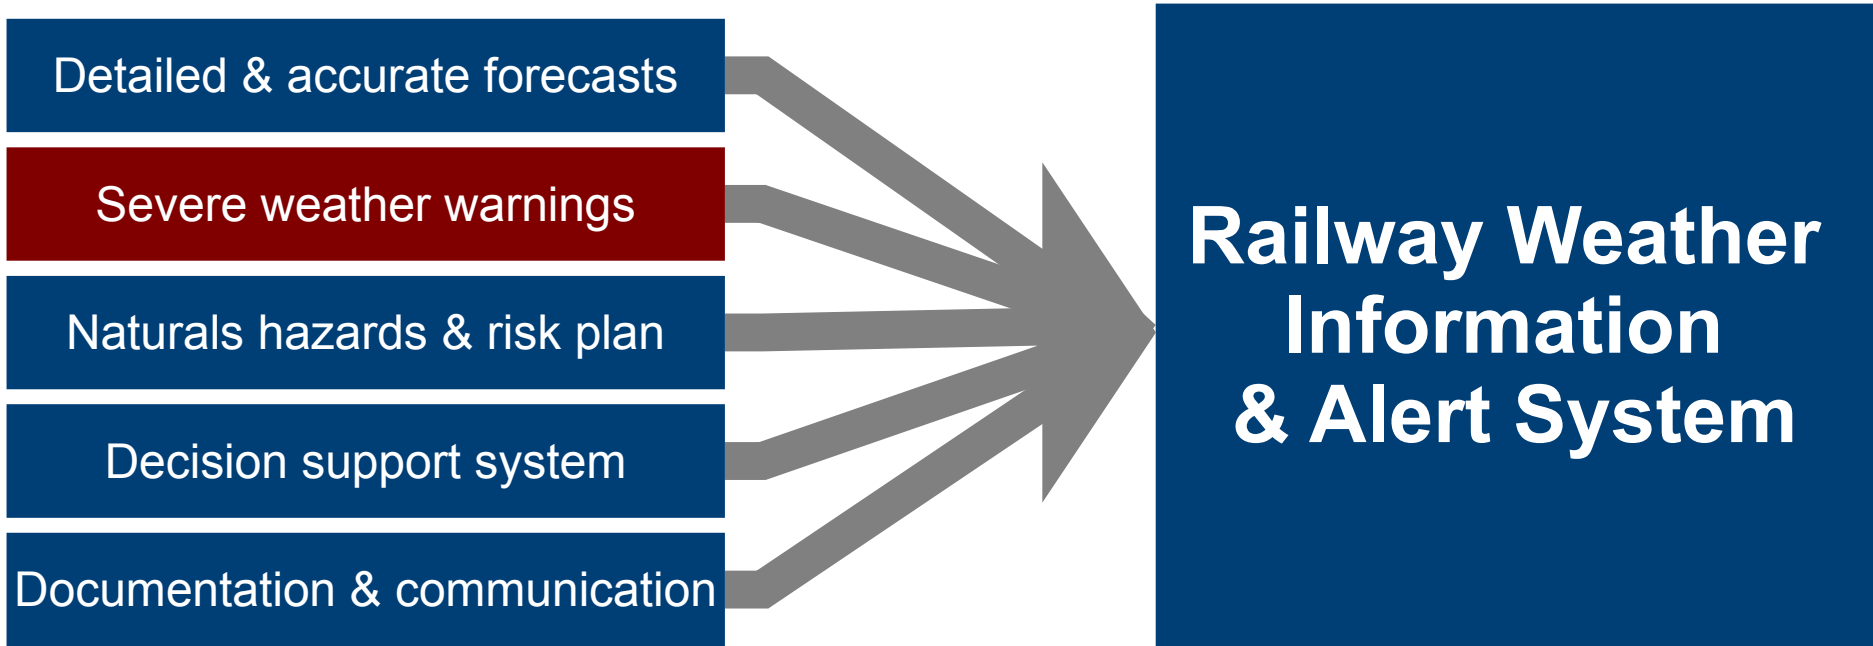

- ▶ Highly precise weather forecasts along the railway lines
- ▶ Exact snow forecasts for the planning of winter services
- ▶ Severe Weather Warnings for the safety of railway operation

▶ **The system includes:**

- ▶ On demand weather forecasts by special infrastructure weather models
- ▶ Weather warning system
- ▶ Flash flood warning system
- ▶ Fire risk warning system
- ▶ Weather station data
- ▶ Flooding predictions

The Weather Alert and Informations system of ÖBB is considered as an best practice example by respective EU projects

Weather forecast & warning systems for railways

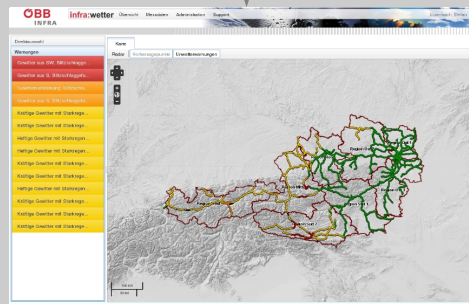

Information process:

Weather Information & Warning System

Railway Operator

The Austrian infra.wetter

- ▶ On demand forecasts for important railway stations or critical points along the tracks
- ▶ High resolution weather model with a complete implementation of the railway network
- ▶ Exact calculation of important meteorological parameters like temperature, windspeed, precipitation, snowfall, snow line,...
- ▶ Essential for the organization of the whole railway operation (planning of human resources, snow removal,...)
- ▶ Weather warnings for safe operation!

Warnungen

Warnung ROT: Bis Montagnachmittag 20-30 cm Neuschnee, teils auch etwas mehr

Am späten Sonntagnachmittag setzen mit einer Kaltfront Regen und Schneefall ein. Dabei befindet sich die Schneefallgrenze zu Beginn bei etwa 1000 m und sinkt bis zum Abend rasch bis in die Täler ab. Anschließend schneit es mit mäßiger bis starker Intensität bis Montagvormittag weiter. Bis dahin können verbreitet 20 bis 30 cm Neuschnee zusammen, in Lagen oberhalb etwa 1000 m teils auch etwas mehr. Der Montagnachmittag verläuft dann bereits weitgehend trocken.

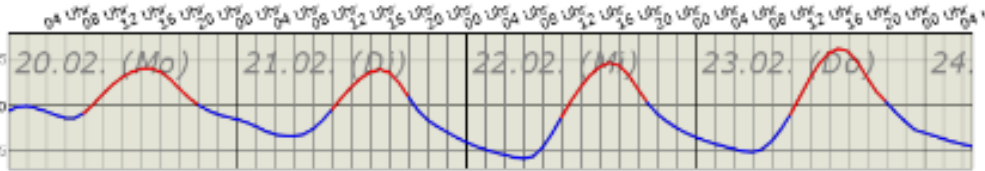

Gültig vom 19.02. 19:00 Uhr bis 20.02. 14:00 Uhr

Aussichten : Tabelle

Warnungen

ORANGE-WARNUNG: Erneut Südöhn, ab dem späten Nachmittag einzelne Böen von 70 bis 80 km/h

Am Montag lebt im Tagesverlauf erneut teils kräftiger Südöhn auf. Ab dem späten Nachmittag sind besonders in freien und exponierten Lagen einzelne Böen von 70 bis 80 km/h zu erwarten, kurzzeitig sind auch noch stärkere Böen möglich. In der Nacht auf Dienstag flaut der Wind dann wieder ab.

Further best practice examples

▶ **SNCF** (France)

- ▶ Special emergency time tables at severe weather events
- ▶ Passenger and customer information when these time tables are in place
- ▶ Information videos for passengers
- ▶ Passengers know what delays are expected and which trains will be cancelled

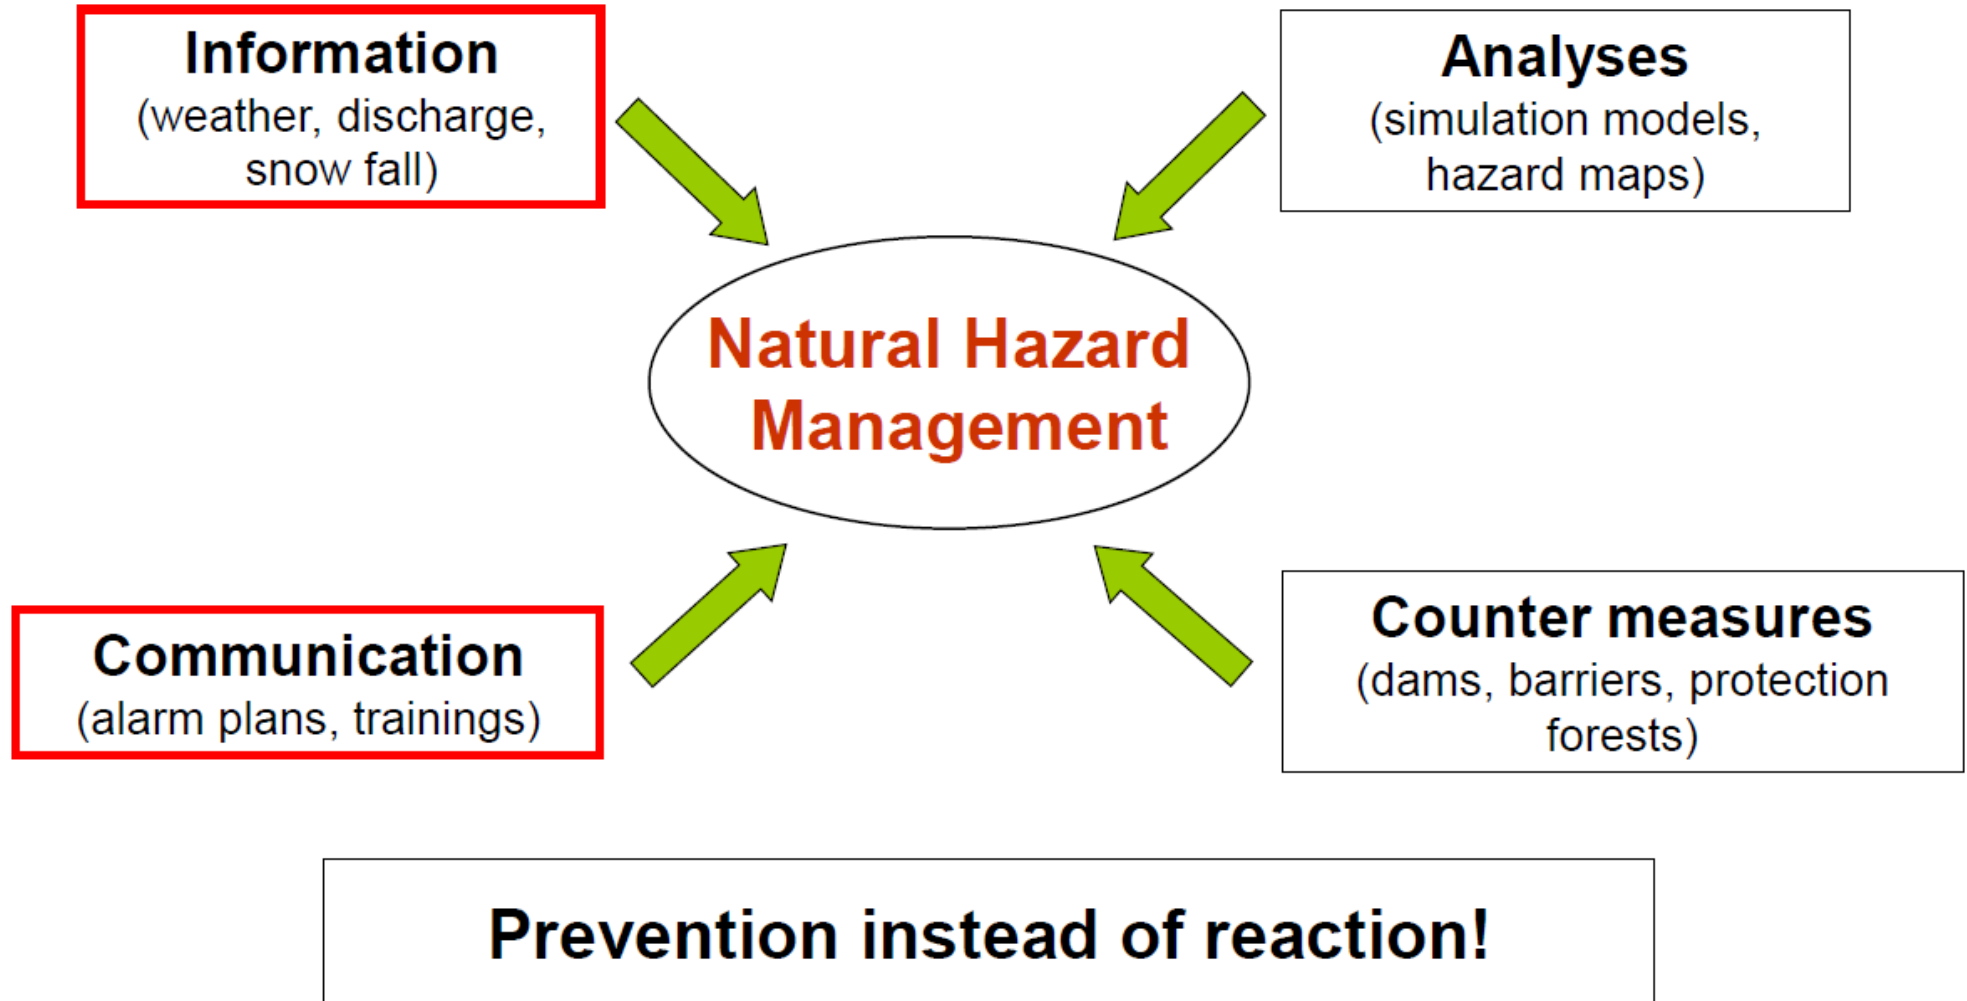

▶ **ÖBB** (Austria)

- ▶ Handbuch Winterdienst (handbook winter service)
- ▶ Checklists and decisions support for the whole winter operation, based on forecasts

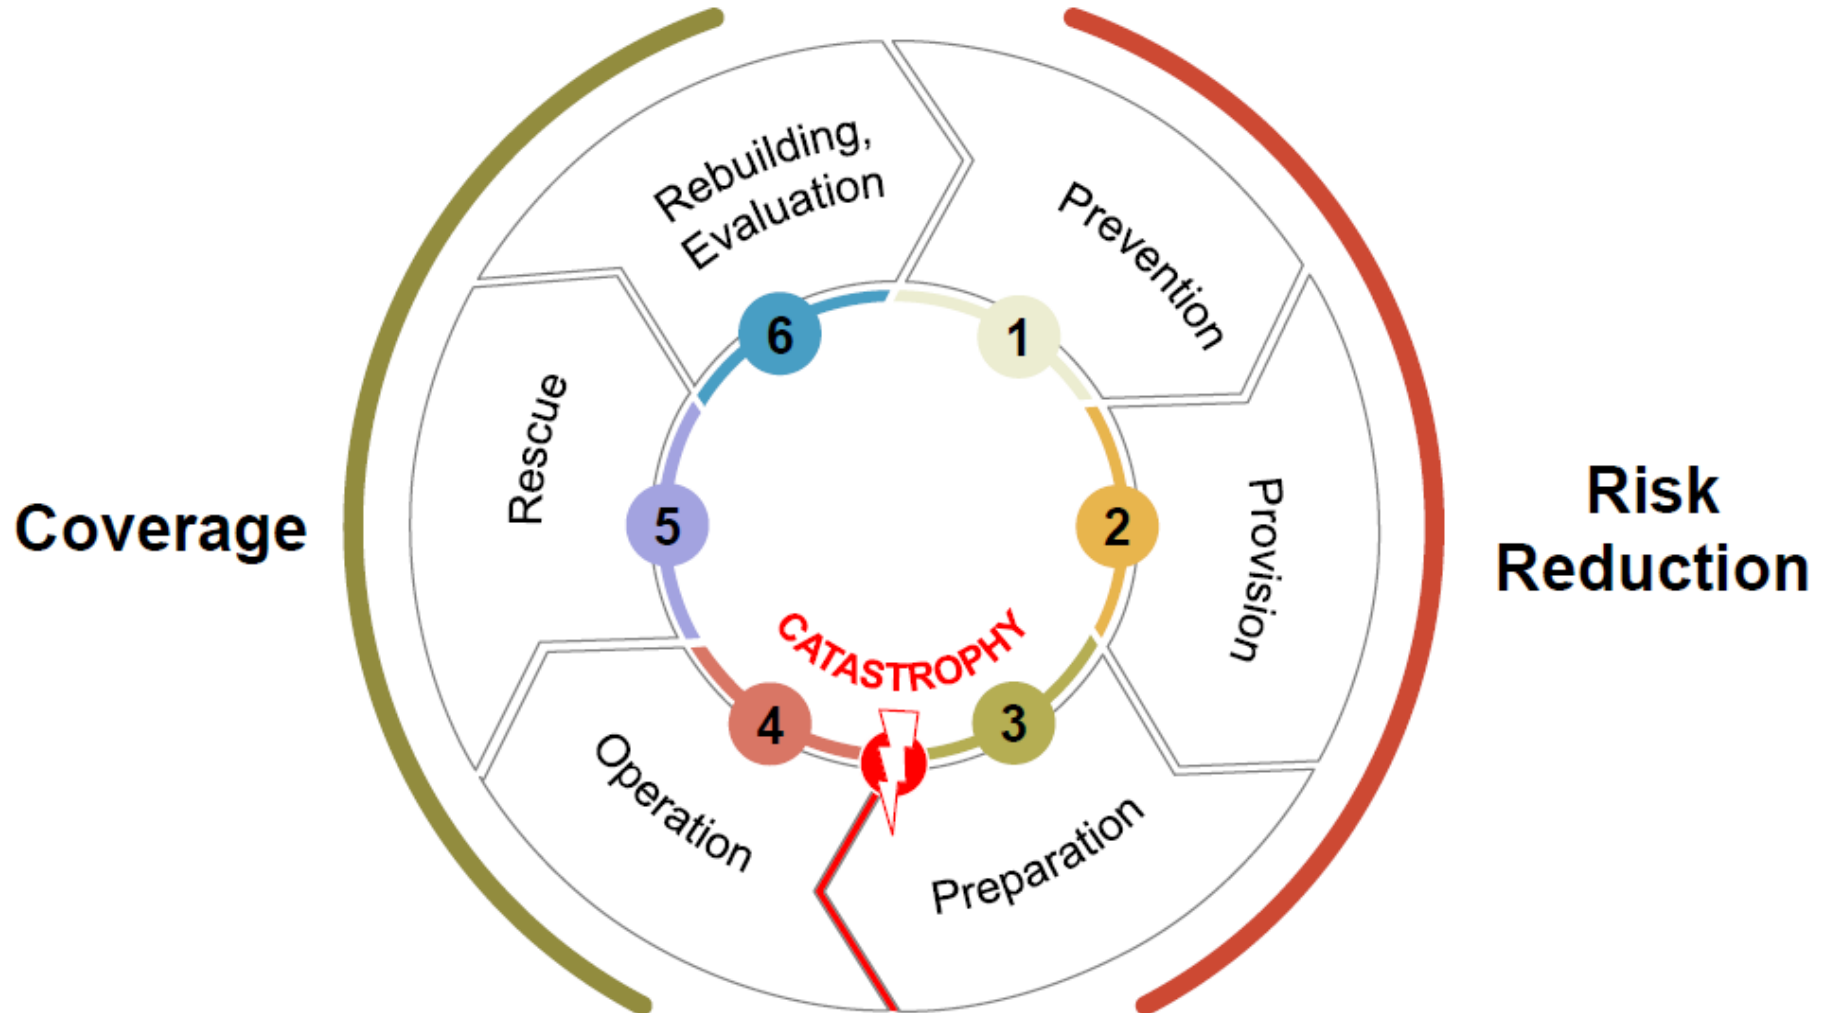

▶ **ÖBB** (Austria) and **SBB** (Switzerland)

- ▶ Natural Hazards Departments
- ▶ Own departments for risk analysis and risk prevention
- ▶ Special trained core staff for natural hazards

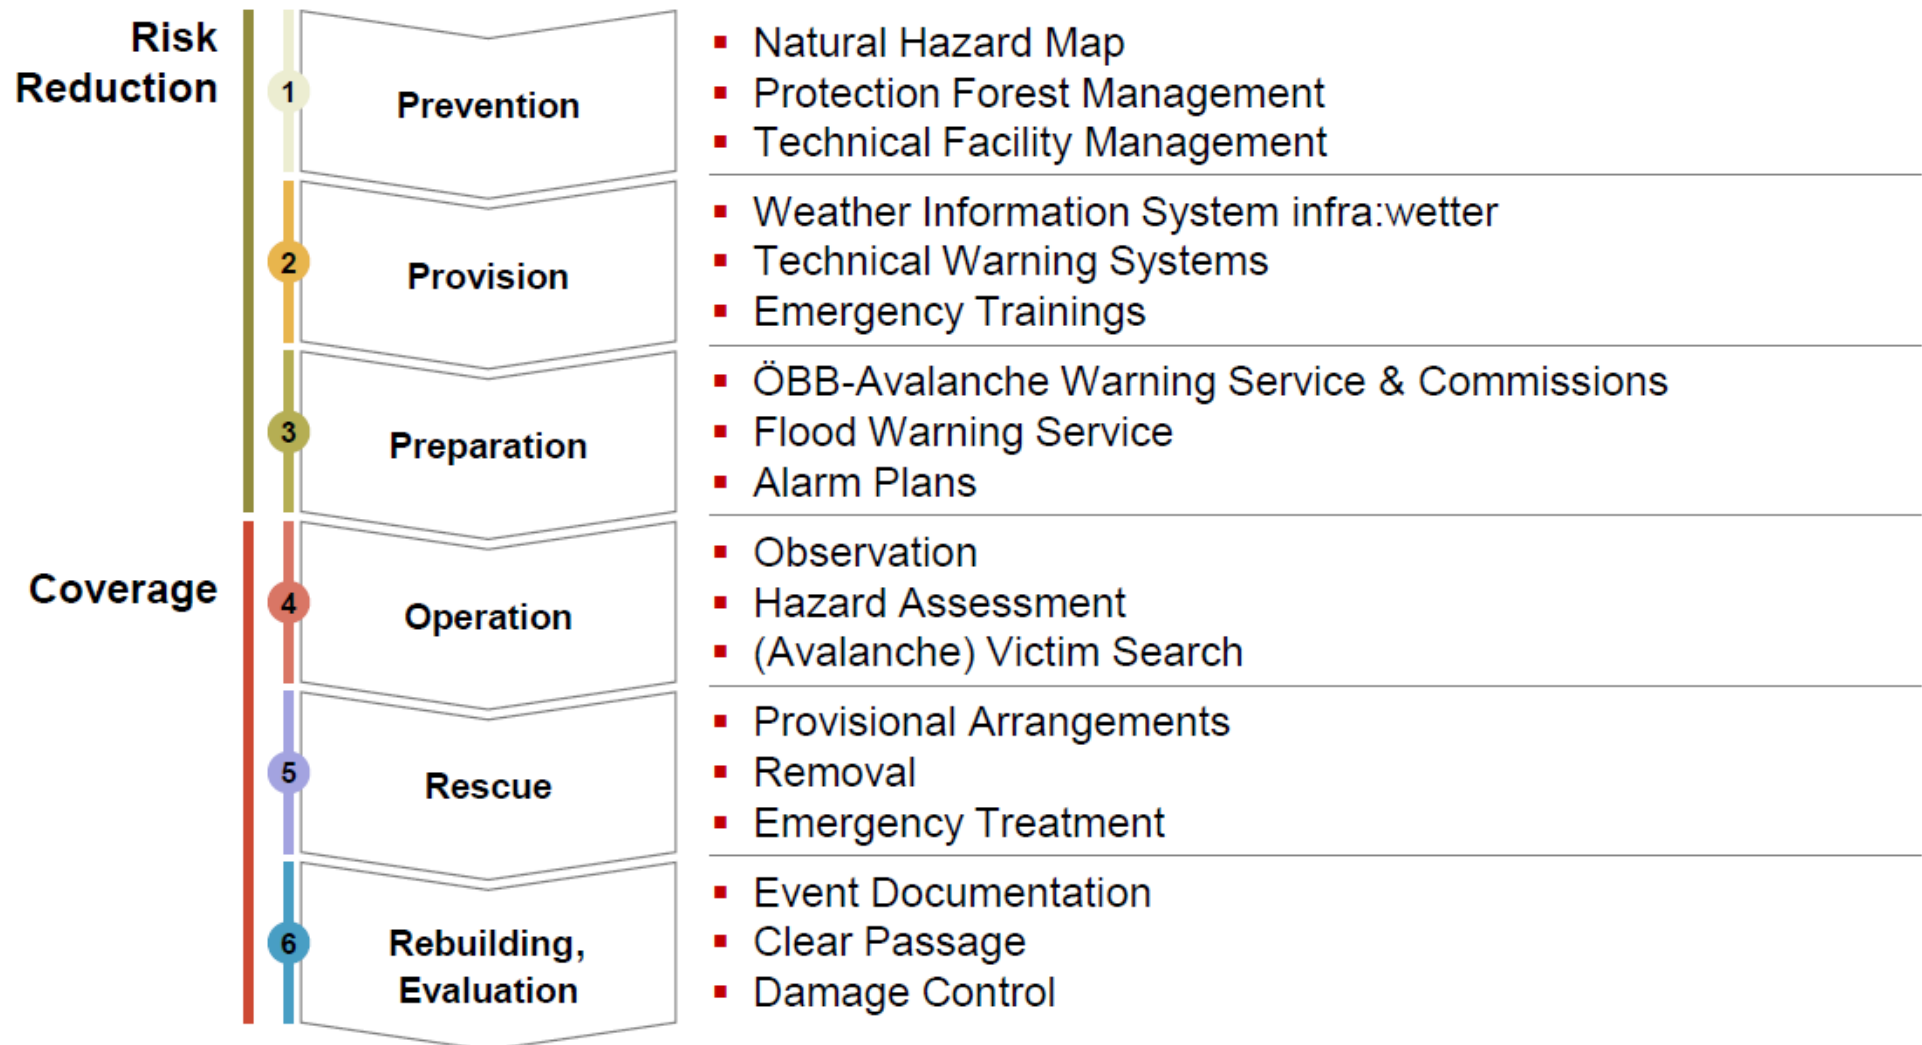

ÖBB Natural Hazards Management System

ÖBB Natural Hazards Management System

ÖBB Natural Hazards Management System

Latest ÖBB Project: Security Deficit

- ▶ Analysis of potential Natural Hazards for all railway lines in Austria!
- ▶ Evaluation of security issues on track sections, bridges, mountain tracks,...
- ▶ Implementation of a “Security Deficit” map for the railway lines
- ▶ Definition of measures e.g.
 - ▶ **Security Deficit 1** = OK
 - ▶ **Security Deficit 3** = Weather Alert System
 - ▶ **Security Deficit 5** = Very urgent construction works

km 83,2 - 83,7	sehr hohes Risiko

Project Idea

Natural Hazard Risk Map for Eurasian Corridors

Natural Hazard Risk Map

- ▶ Evaluation of possible (natural) dangers for rail corridors
 - ▶ Heavy rain & flash floods
 - ▶ Large scale flooding
 - ▶ Heat waves & fire risk
 - ▶ Heavy snowfall & snow drifts
 - ▶ Sand storms
 - ▶ etc.

- ▶ Analysis of typical meteorological pattern within the last years and anomalies

- ▶ Connection of GIS Analysis (Mountain Slopes, Rivers, Vegetation) and meteorological data

- ▶ Consideration of future developments, based on the IPCC reports

GOAL: MAP WITH ALL POTENTIAL (NATURAL) RISKS FOR RAILWAY LINES

Current & planned research projects

Switch Points

Energy consumption forecasts & active steering

Blowing Snow

Implementation of blowing snow forecasts into the system

Ice on overhead lines

Development of ice forecasts on overhead contact lines

Ice detection sensor

Adoption of ice detection sensors to the railway environment

Forecasts for switch points

- ▶ Short term weather forecasts for switch point heatings
 - ▶ Preheating of switches 1 hour before snow fall is expected
 - ▶  **less failures**
 - ▶ Reduced heating at not severe snowfall events
 - ▶  **less energy consumption**
 - ▶ Forecast parameters:
 - ▶ Temperature
 - ▶ Fresh Snow
 - ▶ Drifting snow by wind and trains
- ▶ Remote weather data for switches
 - ▶ Improvement of switch point weather sensors, incl. communication unit
- ▶ Energy consumption calculation for the next 3 days
 - ▶ Estimated energy need for switch point heatings across your network

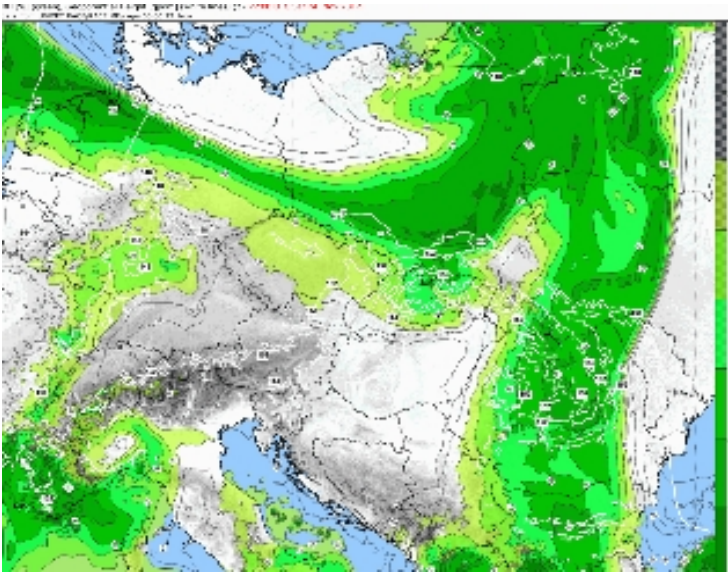

Blowing Snow

- ▶ Drifting snow is affecting the railway operation to a very high degree
 - ▶ Snowdrifts
 - ▶ problems with switches
 - ▶ ...

- ▶ UBIMET developed 2012 a blowing snow index, the tests last winter where very promising

- ▶ The implementation into the railweather systems is planned for winter 2013/14

Concept of Ice/Frost Analysis & Forecasts

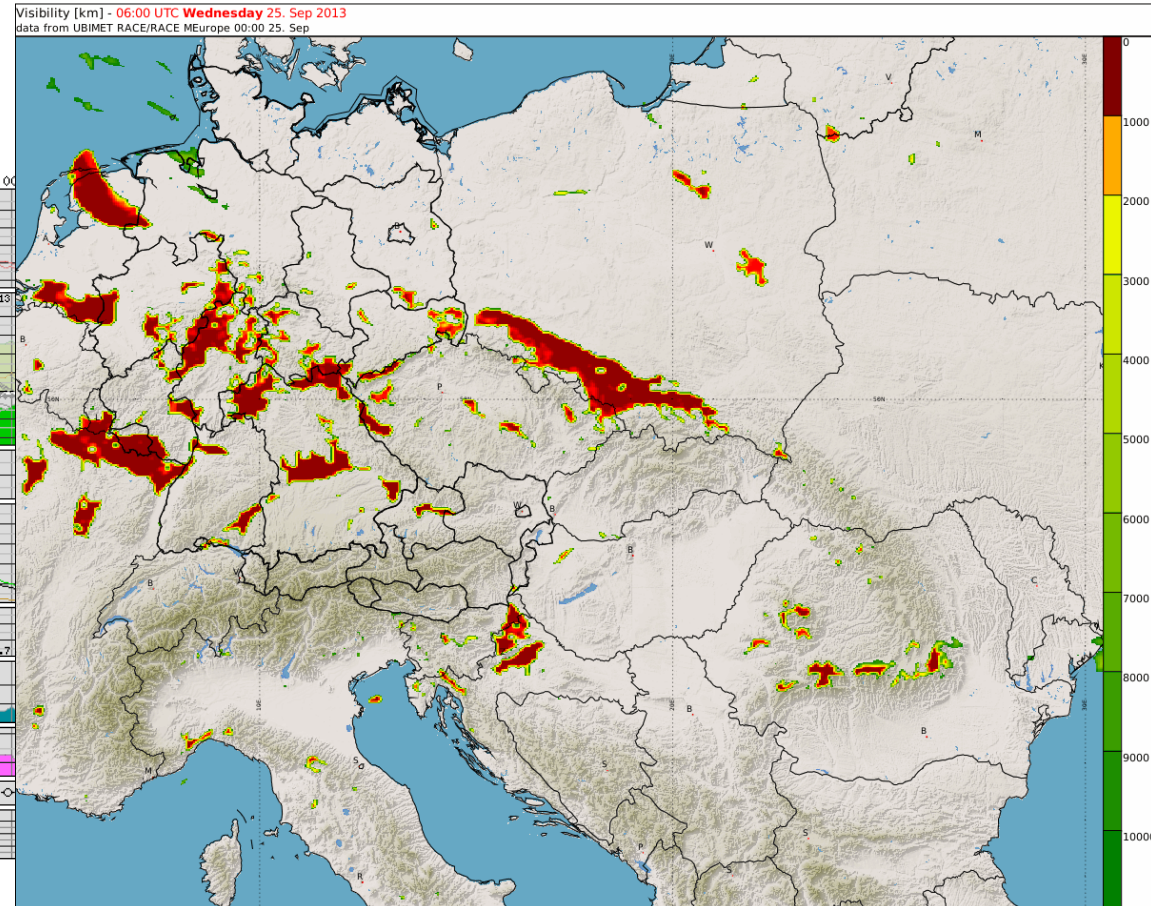

- ▶ Hourly or nocturnal frost forecasts & analysis for overhead contact lines
- ▶ Estimation of severity of hoar frost along every railway line at a resolution of 250m
- ▶ Alert system with 4 levels (no hoar frost to severe hoarfrost)

Necessary improvements for the icing model

- ▶ Better simulation of humidity and liquid water content of the air in valleys
- ▶ Adaptation of the downscaling algorithm for alpine valleys and basins
- ▶ Improvement of fog forecasts

Ice detection sensor tests

- ▶ Based on Electrical Capacitance Tomography (ECT)
- ▶ Output signal interpretation by an algorithm developed by the Technical University of Graz (Austria)
- ▶ Field tests and laboratory tests showed an excellent repeatability of the measurements

Ice detection sensor prototype

- ▶ High sensitivity for thin layers of ice
- ▶ Water (melting ice, rain,...) clearly distinguishable from solid ice
- ▶ Multichannel Measurements to determine the thickness of the ice layer
- ▶ Information about the structure and density of the ice

Goals of the project

- ▶ Validation of numerical icing forecasts and analysis models
- ▶ Adaptation of the models based on the feedback of local railway employees, as well of weather station data and/or ice measurements sensors
- ▶ Test of the ice detection sensor in a railway environment
- ▶ OUTPUT = Icing alert index for railway operators (forecast & real time data)

Implementation of the icing information system

- ▶ Implementation of the icing information into the weather information systems of the respective railway
- ▶ Real time data from sensors:
 - ▶ Special weather station
 - ▶ Ice detection sensor
- ▶ Regional analysis of the icing risk based on the railway track data
- ▶ Detailed forecasts of the icing risk for every railway line with a resolution of 250m
