Conclusion

Questions

# Circular economy

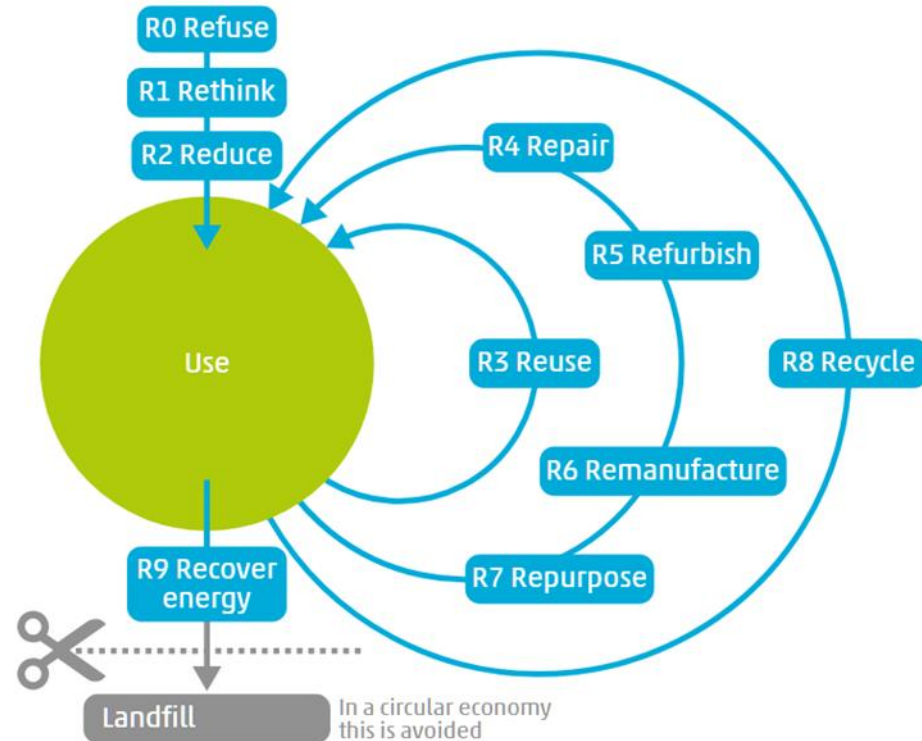

# Circular economy

- The Dutch economy must run entirely on reusable raw materials by 2050
- National Program Circular Economy
  - Cooperation government, companies and social organizations
- Transition agenda for 5 sectors:
  - Plastics
  - Consumer goods
  - Construction (50 percent of raw material use)
  - Manufacturing industry
  - Biomass and food
- Specific goals for product groups with highest impact:
  - In consumer goods, for example: electrical and electronic appliances, packaging and disposable products, textiles, furnitures
- Monitoring
  - National Conference Circular Economy (annual)
  - Integral Circular Economy Report (ICER, every other year)

# Circular economy: R-ladder

- Different strategies
- Level of circularity / saving on raw materials
- R0 is the highest step

History

Conclusion

Questions

# Scope

# Statistical concept: what do we measure?

The regional commodity flow statistics measure:

- The international and national, physical commodity flows that are unloaded, loaded, delivered or shipped on Dutch territory in Europe, in value and gross weight and by year, flow type, region, commodity group and possibly use category.

Not included:

- Services
- Electricity, data
- Transport in the Caribbean Netherlands

# Dimensions final tables

- Year (2015-2022)
- Value and gross weight of the goods
- Flow type
  - Imports/exports from/to foreign countries, imports/exports from/to rest of Netherlands, re-exports, transit trade, production for use in own region, distribution
- Provinces and NUTS 3+ regions\*
- Commodity group (CE25)
- Only for Amsterdam and Rijnmond: use category
  - Production, services provided by companies, consumption households, consumption government / investments
- Including confidence intervals

\* With further breakdown of some of the NUTS 3 regions leading to 52 regions in total.

# Provinces and NUTS 3+ regions

12 provinces

40 NUTS 3 regions  
(52 NUTS 3+ regions)

Source: [www.regioatlas.nl](http://www.regioatlas.nl)

# Commodity groups (CE25)

1	Agricultural and horticultural products	14	Plastics, rubber
2	Forest products	15	Basic metals and basic metal products
3	Livestock, hunting and fishing products	16	Metal products
4	Food, vegetable	17	Machines for industry
5	Food, animal	18	Other machines
6	Food, other	19	Transport equipment
7	Coal, lignite, natural gas and crude oil	20	Textiles
8	Coke and petroleum products	21	Clothing, fur and leather
9	Ores	22	Wood and cork products, paper and pulp
10	Salt, sand, gravel, clay	23	Furniture
11	Other mineral products	24	Waste and secondary raw materials
12	Chemical products and fertilizer	25	Other goods
13	Pharmaceutical and chemical products

Questions

# Data, methods

# Integration trade and transport data

## Supply and Use Tables (SUT)

- supply, use
- value
- commodity group
- sector

## Processed SUT data

- supply, use
- value, gross weight
- commodity group (CE25)
- NUTS 3+ region
- origin/destination
- use category
- confidence interval

## International trade data

- imports, (re-)exports
- value, gross weight
- commodity type (CN8)

## Processed trade data

- imports, (re-)exports
- value, gross weight
- commodity group (CE25)
- NUTS 3+ region
- use category imports
- confidence interval

## Transport data

- inbound/outbound transport
- gross weight
- commodity group (NSTR, NST 2007)
- country, NUTS 3+ region (un)loading

## Processed transport data

- inbound/outbound transport
- value, gross weight
- commodity group (CE25)
- NUTS 3+ region
- origin/destination
- confidence interval

## Regional accounts

- production, intermediate use, working people
- value
- sector
- NUTS 3+ region

## Macro-integration

## Regional commodity flows

- value, gross weight
- flow type
- commodity group (CE25)
- province, NUTS 3+ region
- use category
- confidence interval (smaller)
- consistent data

Conclusion

Questions

# Results

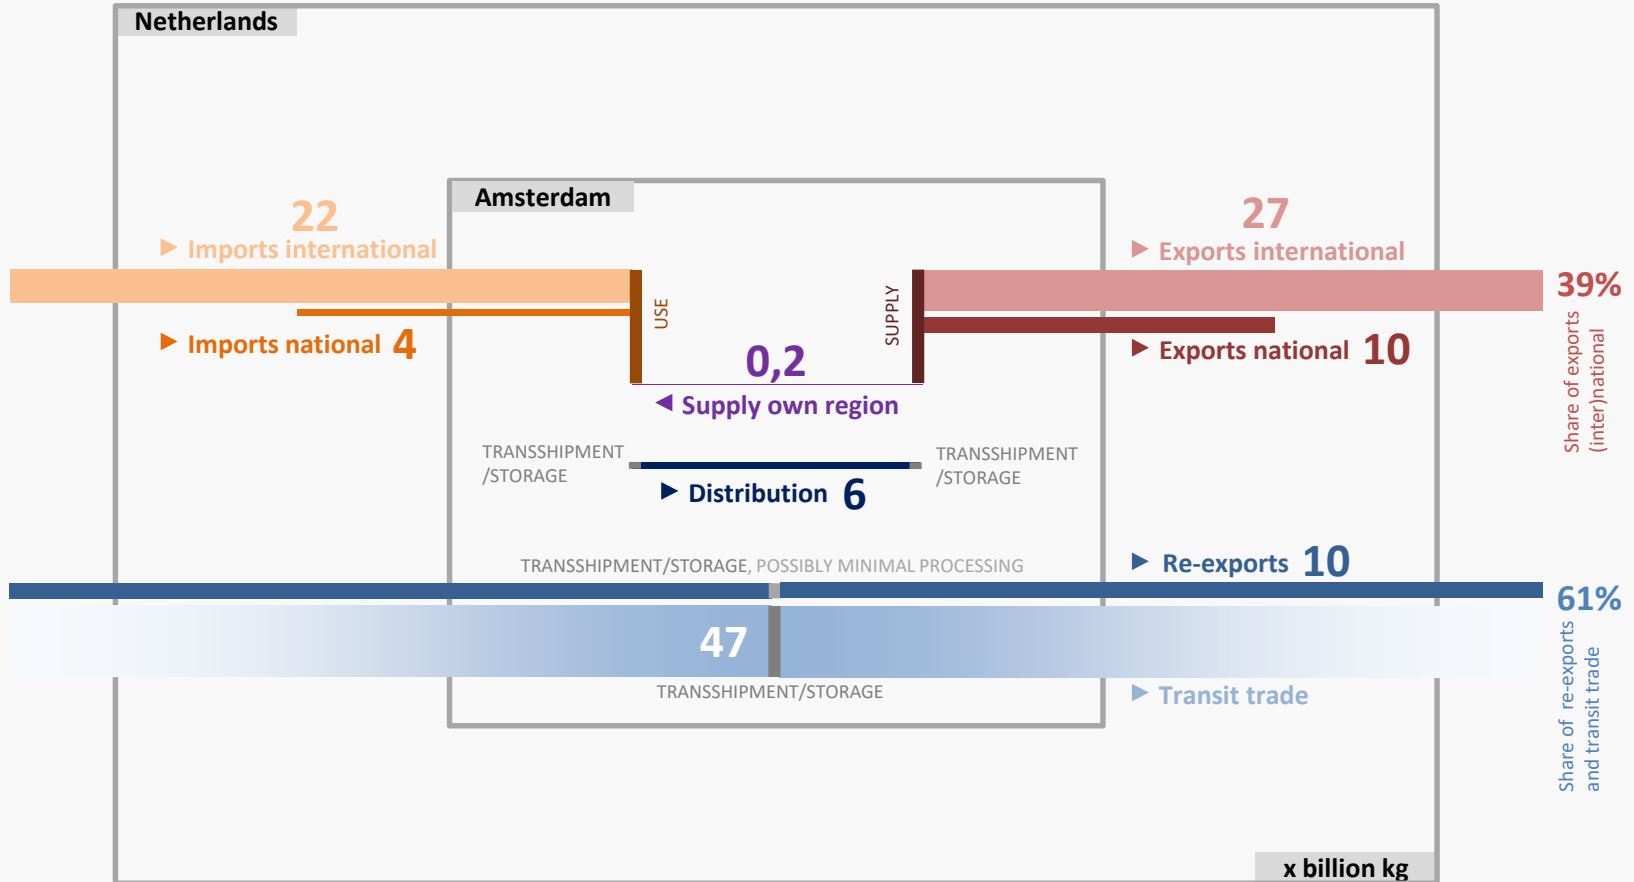

# Questions which can be answered

- What are the most important commodity groups in the use of goods in a region?
- Or: what commodity groups are mainly produced?
- Is a region mainly internationally or nationally oriented with regard to the use of a commodity group?
- How is transit trade developing in a region?
- What are the estimated DMI and DMC for biomass, fossil, metals and minerals?
- Are goods in a region mainly used for production, services or consumption?
- Etc.

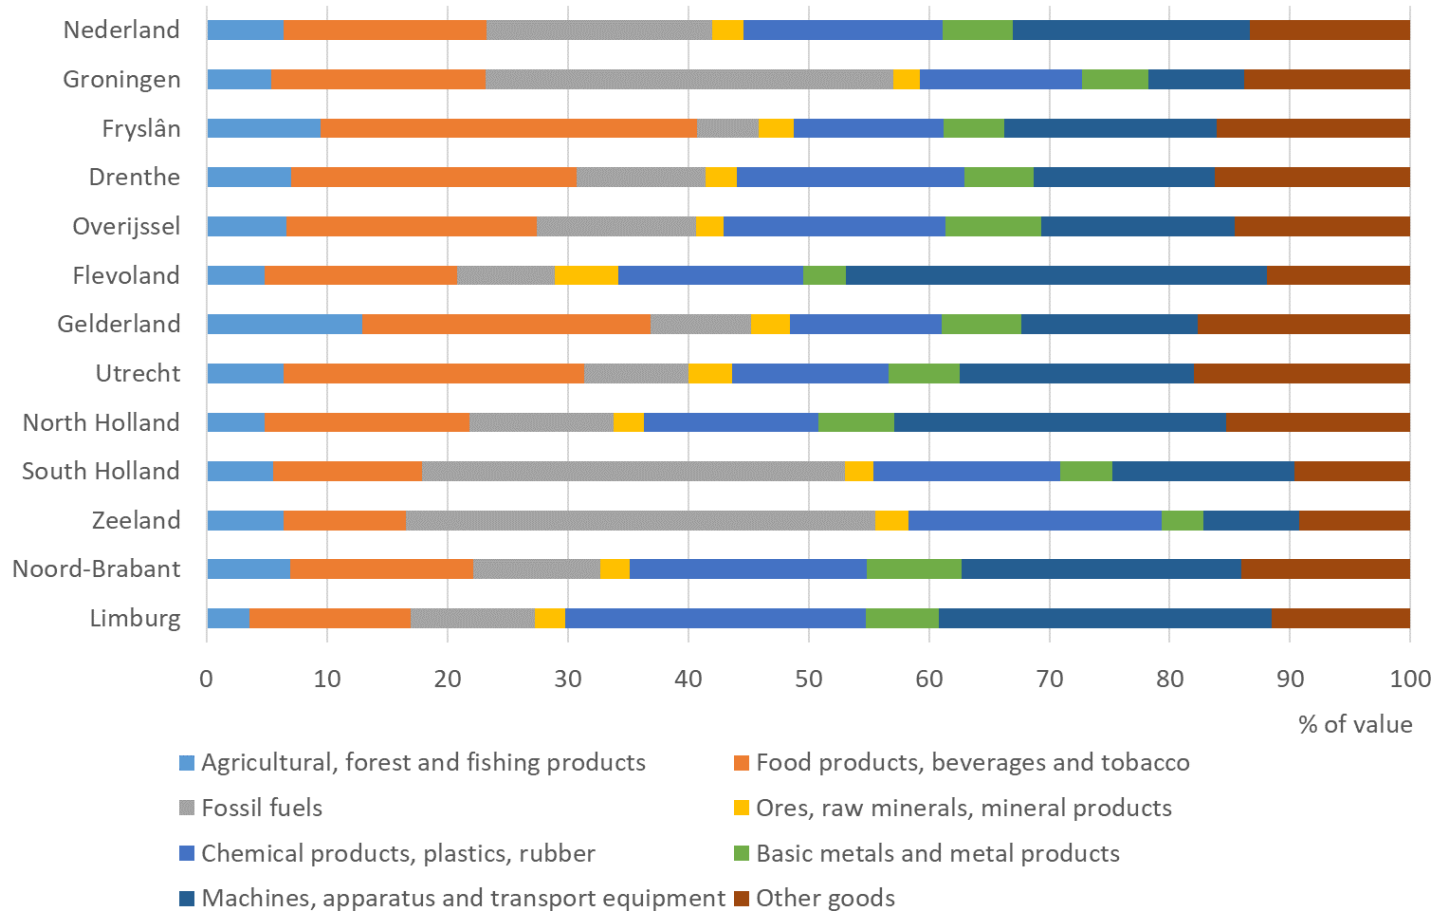

# Gross weight regional commodity flows Amsterdam 2022

# Share of commodity groups by province (% of gross weight)

# Share of commodity groups by province (% of value)

# Share of used goods with origin abroad

**Conclusion** ←

Questions

# Conclusions and recommendations

# Conclusions

- Estimation of regional commodity flows 2015-2022, for provinces/NUTS 3+ regions and 25 commodity groups
- Sources: supply and use tables, international trade and transport statistics, regional accounts
- Integration model -> consistency with restrictions
- Uncertainty margins
- Data at the basis of important indicators for monitoring the transition to a circular economy (DE, DMI, DMC)
- Methods transferable to other countries/regions

# Recommendations

- Add information:
  - Regional data and knowledge: validation!
  - Light utility vehicle transport and domestic pipeline transport
  - Physical supply and use tables (in kg)
  - Container chain data
- Improve method:
  - Improved regionalization international trade data
  - Model-based integration of value and weight at the same time
- Visualize results

## Possible extensions

- Annual update: 2023, 2024, etc.
- Refinement to municipal level (large municipalities)
- More detailed classification of commodity groups
  - For example: secondary raw material separate
- Subdivision by (groups of) economic sectors
- Estimation of flows between provinces
- Emissions of CO<sub>2</sub>, NO<sub>x</sub>, PM, etc. related to transport

# Questions

*Does “circularity” in your project refer more about economic self-sufficiency and sustainability in terms of resource use, rather than the traditional focus of a circular economy on minimizing waste and reusing materials?*

The policy surrounding the circular economy has various strategies, represented by the R-ladder (see slide 8 of this presentation). At the highest level (refuse, rethink, reduce), the use of materials is reduced, e.g. by making products redundant, encouraging the shared use of products and organizing production processes in such a way that fewer materials are needed. Lower on the R ladder are the reuse of (parts of) products (re-use, repair, refurbish, remanufacture, repurpose), processing into new products (recycle) and incineration with energy recovery (recover). See:

<https://ikwilcirculairinkopen.nl/de-r-ladder-wat-is-het-en-wat-kun-je-ermee/> (in Dutch)

<https://www.circles.fm/en/news/research-developments/823445654/the-r-ladder-strategyfor-circularity>

<https://circulareconomy.europa.eu/platform/sites/default/files/pbl-2019-outline-of-the-circular-economy-3633.pdf>

(Chapter 2 describes the R-ladder)

With the statistics on regional commodity flows, we can provide regional governments with insight into the size and composition of the flows of raw materials and end products in their region and the reason why those flows are there, that is: for use in the region, due to production or extraction in the region or due to transit, re-export or distribution. We can then divide the use into use for production purposes, use by service companies (e.g. in the construction sector), consumption by households and consumption by governments or investments in fixed assets. With this annually updated data, regional authorities can monitor the use of materials in their region and better set priorities based on the estimated composition of the goods flows. In addition to circularity, security of supply is also a point of attention for national and regional governments. Then, it helps to know where the goods come from, i.e. on which other regions or countries a region or country is dependent.
